CONTENTS

Our products are updated to the newest standard developments and technologies which makes it necessary to reserve the right to product changes without notice.

R. STAHL in North America

R. STAHL, INC. has been in North America for almost 30 years. Located in Houston, Texas and Alberta, Canada, we have expanded to include over 40 representatives throughout the Americas. Our service is unmatched, with qualified technical experts that can be reached in real time, not seven hours away in Europe.

Expertise
where safety knows no compromise

One hundred thirty years after our founding, with facilities strategically located on five continents, R. STAHL is acknowledged as the world's foremost innovator in explosion-protected components and systems for Automation, Control and distribution, Operations and monitoring, Lighting and Signals & Alarms.

Our commitment to the Americas commenced in 1979 when R. STAHL introduced intrinsic safety technology to the North American market. It rose to greater prominence in the mid-1990s, when R. STAHL played a leading advocacy role in the harmonization of the U.S. National Electrical Code (NEC) and the International Electrical Code (IEC). Changes made at that time yielded increased global standardization, and produced heightened efficiencies and maintenance benefits for international markets.

Our expertise also covers related areas of safety engineering such as functional safety, SIL and FDA. International certifications, approvals, and patents underline our expertise and make it possible for R. STAHL products to be used anywhere in the world. One thing is certain: on the basis of experience and international synergies, we continue to deliver technological innovations tailored to your individual needs.

Benefits

- *All protection methods available*
- *Over 3000 certificates for explosion protection issued*
- *More than 70 active patents*
- *Technical training*
- *Member of many international committees, technical commissions and research groups (Profibus, Fieldbus Foundation, HART etc.)*
- *In-house testing laboratory*

More Than Protection

PEACE OF MIND

Our Mission

"We provide products and services to protect the most valuable – and often irreplaceable – assets of some of the most critical industries on Earth."

Applications

- *Petroleum and natural gas deliveries*
- *Petroleum and natural gas storage and transporters*
- *Petrochemical industry*
- *Chemical industry*
- *Pharmaceutical industry*
- *Food product, beverage and tobacco industries*
- *Shipbuilding and offshore industries*
- *Food processing industry*
- *Water purification*
- *Automotive*
- *Original equipment manufacture*

In the production, processing, transportation and storage of many materials, grave danger can exist. Flammable gasses, vapors, mists and dusts can occur that, when combined with oxygen in the air, form an explosive atmosphere. Given a source of ignition, these substances can detonate and destroy life and property in seconds.

Our job at R. STAHL is to create products and deliver services to eliminate the possibility of such an incident. And in fulfilling this role, we offer *More than Protection. Peace of Mind.* Our products are the most innovative in the world.

Promises to our customers

- We provide you the best engineering minds available to protect your people and property from explosions.
- We offer you only products we know to embody the finest technology and craftsmanship.
- We carefully develop and engineer the right solutions for your individual applications.
- We deliver your products and services quickly and efficiently.
- We serve you in a manner that places Stahl above our competitors in providing you "peace of mind" concerning the safety of your people and property.

Manufacturing

COMMITTED TO TEAMWORK

Production Plants:

- *Houston*
- *Waldenburg*
- *Weimar*
- *Cologne*
- *Hengelo*
- *Stavanger*
- *Chennai*
- *Shanghai*

R. STAHL's global headquarters is located in Waldenburg Germany. Located in Houston, Texas, R.STAHL Inc. is proud of it's world class manufacturing, engineering and technical service competency. Here our engineers work together in teams to develop tailor-made, reliable and cost-effective solutions for complex systems worldwide. Project management and production departments work side by side in state of the art facilities to foster communication and cooperation between all departments throughout the entire production process. Flat hierarchies, flexibility, and open dialog describe our culture. Our large portfolio of components and systems, one of the most comprehensive in the world, is the basis for our explosion protection system solutions, all of which are carefully designed to work seamlessly with each other. This guarantees our customers the reliability they require and the assurance that a project will be successful. Our expert representatives will update you on your project status at any time. Our other manufacturing facilities located in Weimar and Cologne (Germany), Stavanger (Norway), Hengelo (Netherlands), Chennai (India) and Shanghai (China) adhere to the same high standards.

Development & Laboratory/Certification

Development

- *6% of our annual revenue is reinvested in the innovation process*
- *40% of our revenue has been generated with products launched into the market in the past five years*
- *We actively participate in international committees*
- *We use state of the art CAD systems and provide rapid prototyping*

Laboratory/Certification

- *All key tests are performed on site in our own state of the art testing facilities*
- *We hold over 3,000 international certificates for explosion protection, shipping vessel approvals and functional safety*
- *We offer factory accepted testing for domestic and international projects*

Project Planning & Production

Project Planning

- *Extensive cooperation with customers to develop the optimal solution*
- *Highly skilled engineers with international experience design solutions based on your individual needs*

Production

- *Manufacturing plants located in: Houston, Texas (USA), Waldenburg, Weimar & Cologne (Germany), Hengelo (Netherlands) Stavanger (Norway), Shanghai (China) and Chennai (India)*
- *Flexible production and organized manufacturing provides effective communication between all departments*
- *In-house occupational training center with educated trainers*
- *In-house tool-and-die manufacturing facilities*

Quality Management & On-site Acceptance Testing

Quality Management

- *ISO 9000 certified in 1993 and ISO 9001 in 2004*
- *Quality management process covers the whole supply chain*
- *Quality management system is approved by PTB*
- *Calibration laboratory monitors over 2,000 items of electrical and mechanical test equipment*
- *Production process is covered by quality assurance*

On-site Acceptance Testing

- *State of the art testing and inspection equipment*
- *Intensive technical support*
- *Personnel are continuously trained on the latest technology*
- *On-site consultants are in direct contact with development product managers*

After-Sales Service & Logistics

After-Sales Service

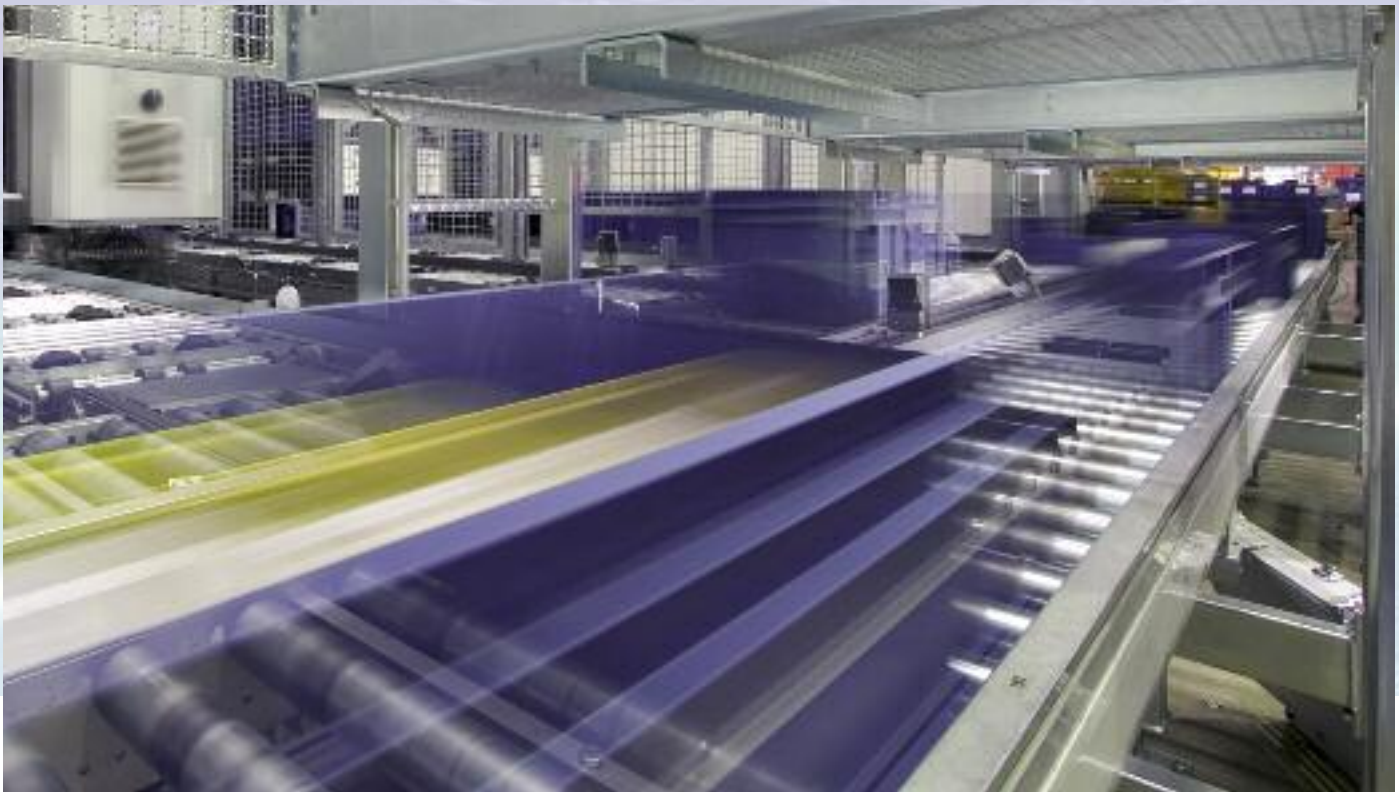
- *Extended warranty on products and services*
- *Field service engineers available*
- *Competent information given by telephone and email*

Logistics

- *Efficient and economical workflow*
- *Modern, fully automatic high-bay warehouse*
- *Production organized on the kanban principle*

Service

WE HAVE YOU COVERED



Protecting lives and equipment is R. STAHL's highest priority. When you partner with R. STAHL in this endeavor you can be assured that our customized, technically advanced, comprehensive products and services receive the highest quality of service.

OEM service

On a worldwide basis, Original Equipment Manufacturers are continuously looking to expand their markets for existing and new system designs. When market opportunities arise that require ATEX or IEC certification for markets, such as Europe, the Middle East, Asia and Russia, R. STAHL is the preferred partner. In North America, producing custom, quality products — often with extremely tight turnaround —is an R. STAHL specialty.

With our more than fifty years of Experience, we stand ready to guide and educate OEMs and their engineering teams in meeting global electrical codes and standards in all harsh environments and hazardous (classified) locations.

- *Development of individual solutions*
- *Technical service*
- *After-sales service*
- *Expert information available via hotlines*
- *Global distribution network*
- *Relevant information via www.rstahl.com*
- *Permanent order status updates*
- *Flexibility*
- *Quality management*
- *Fast, reliable shipping*
- *24-hour turnaround on pick-and-pull items*
- *International customer support*
- *International shipping*
- *Training*

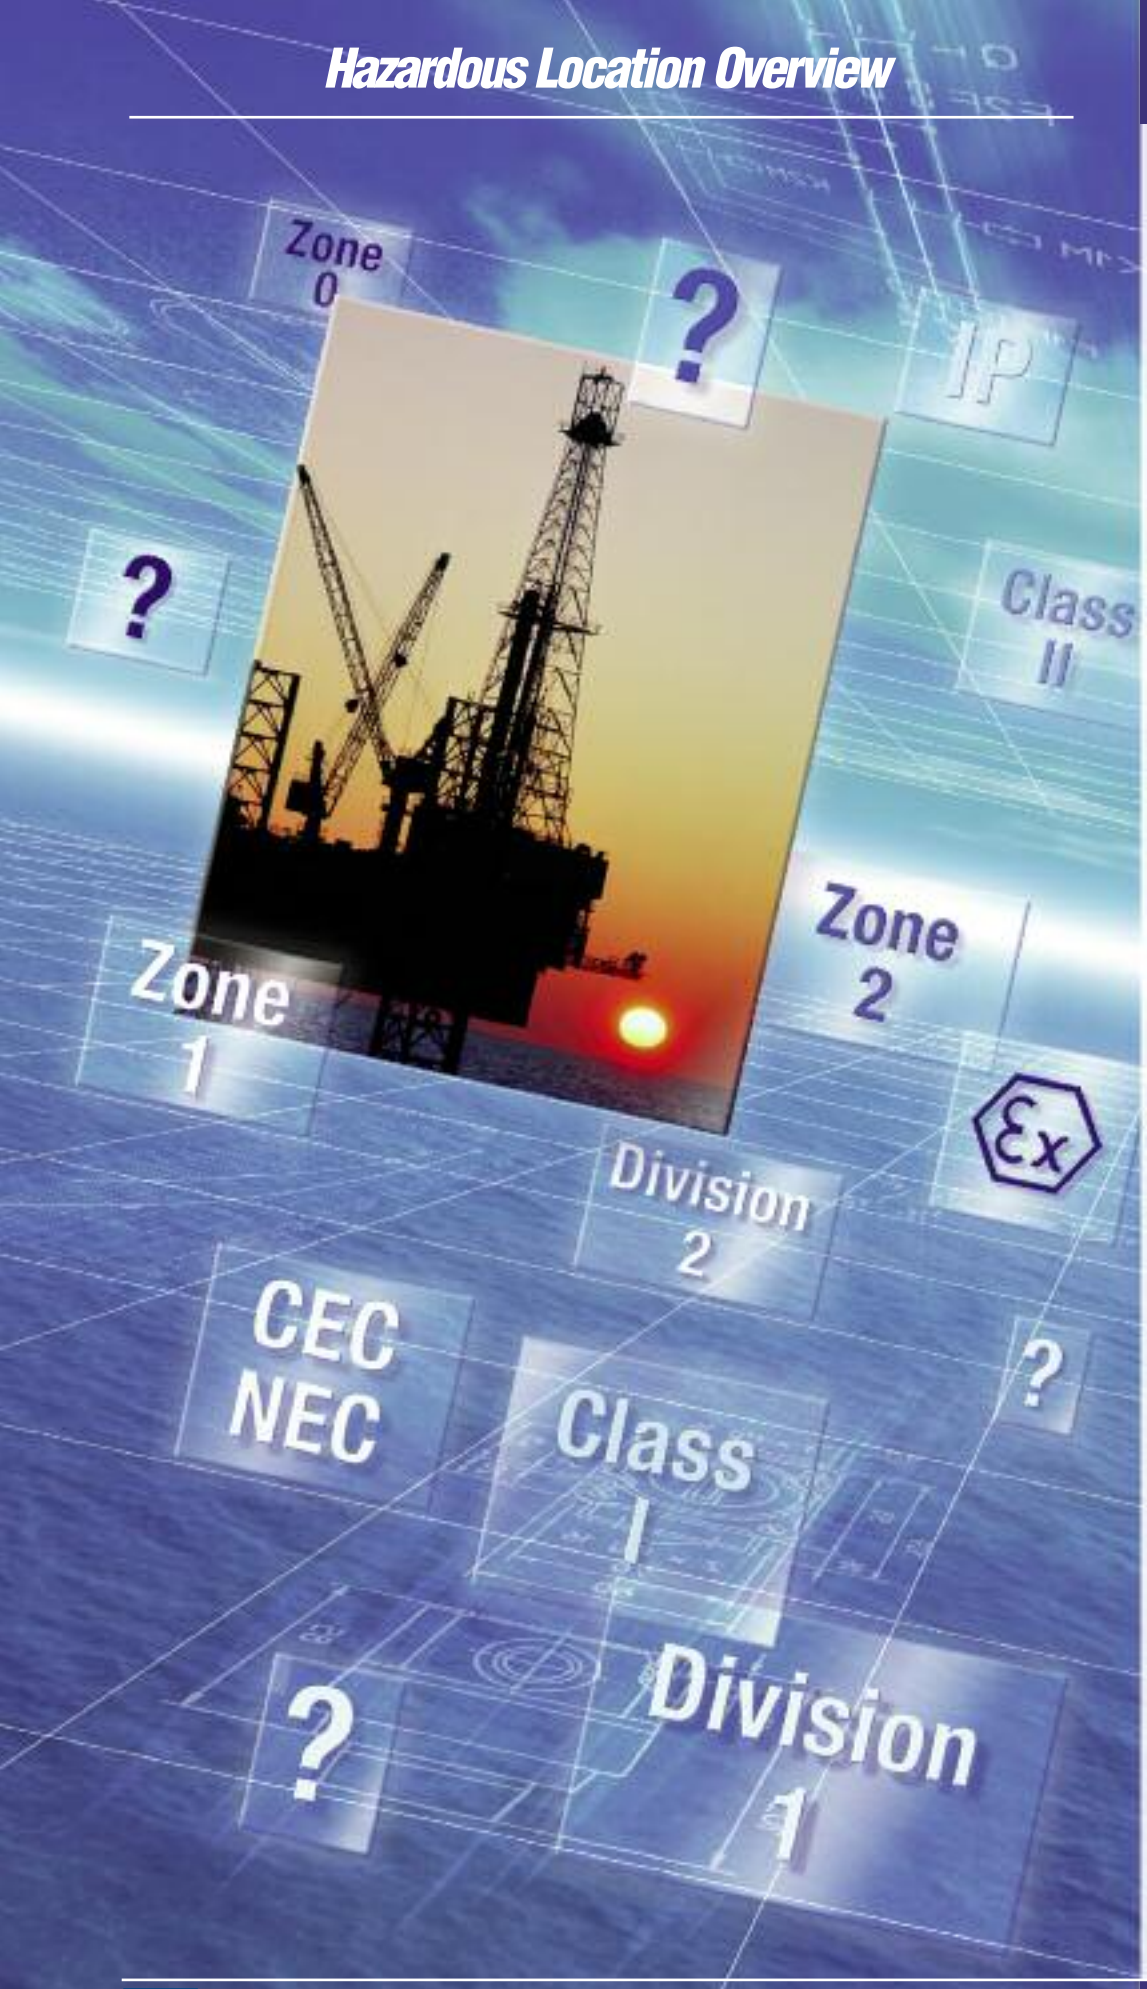
Training

GOOD TO KNOW

- *Training programs*
- *In-house training center*
- *Training classes conducted at the customer's facility*

Competent and trained employees are the most important link in a safe production chain. Remaining at the top of an industry requires committed employees who work diligently with new technologies and implement new safety regulations. At R. STAHL, we are aware of this and make our expert knowledge available to you by conducting training classes. Individuals may choose to take advantage of a basic or advanced training class. Theory and practice are conveyed in equal measure by our specialists. Individuals may choose to have training classes at their own location or at our facility. R. STAHL training classes provide participants with valuable knowledge pertaining to engineering, scientific principals and implementation of the NEC, CEC and ATEX requirements.

Hazardous Location Overview



Understanding Global Explosion Protection

- *Class and Division System*
- *Class and Zone System*
- *ATEX/CENELEC Zone System*
- *IEC*

Basics of Explosion Protection

HAZARDOUS LOCATIONS

Hazardous locations are defined as premises, buildings or parts thereof where fire or explosion hazards may exist due to the presence of flammable gases or vapors, flammable liquids, combustible dusts, or easily ignitable fibers or flyings.

Although, flammable gases, vapors and combustible dusts exist almost everywhere, fortunately, they are present only in minute quantities. Simply because flammable gases or vapors, or combustible dusts are present, there is not necessarily a hazardous location. The quantities or concentrations must be sufficient to present a potential explosion hazard.

The electrical codes that deal with these types of hazardous locations areas do not deal with materials such as high explosives, such as dynamite, munitions, or fireworks. Other rules and regulations deal with areas involving these materials.

Understanding "Global" Hazardous Location Requirements

The evolution of hazardous location electrical codes and standards throughout the world has taken two distinct paths. In North America, a "**Class, Division**" System has been used for decades as the basis for area classification of hazardous (classified) locations. Because the hazards and methods of protecting electrical equipment against these hazards differ for different materials, hazardous locations are divided into three Classes, and two Divisions. The Classes are based on the type of hazard and the explosive characteristics of the material with the Divisions being based on the occurrence or risk of fire or explosion that the material presents. While the United States and Canada have some differences in acceptable wiring methods and product standards, their systems are very similar.

In other parts of the world, areas containing explosive atmospheres are dealt with using the "**Zone System**". Zones are based predominantly on the International Electrotechnical Commission (IEC) and European Committee for Electrotechnical Standardization (CENELEC) standards. Whereas North America deals with multiple types of hazardous atmospheres.

HAZARDOUS LOCATION BASICS

In North America, hazardous locations are separated into three "Classes" or types based on the explosive characteristics of the materials. The Classes or type of material is further separated into "Divisions" or "Zones" based on the release of the flammable material. The Zone system has three levels of hazard versus the Division System's two levels.

Hazardous Materials	Class/Division System	Zone System
Gases or Vapors	Class I, Division 1 Class I, Division 2	Zone 0 Zone 1 Zone 2
Combustible Dusts `	Class II, Division 1 Class II, Division 2	Zone 20 Zone 21 Zone 22
Fibers or Flyings	Class III, Division 1 Class III, Division 2	Zone 20 Zone 21 Zone 22

The United States and Canada have adopted Zones for Gases and Vapors

` Zones 20, 21 and 22 for Dust are adopted by Europe and the U.S. but not by Canada.

Class I Locations

Class I locations are those in which flammable "gases or vapors" are, or may be, present in the air in quantities sufficient to produce explosive or ignitible mixtures. The terms, "gases or vapors" differentiates between materials that are in a gaseous state under normal atmospheric conditions, such as hydrogen or methane, and a vapor that is flashed off from a liquid, under normal atmospheric conditions, such as gasoline.

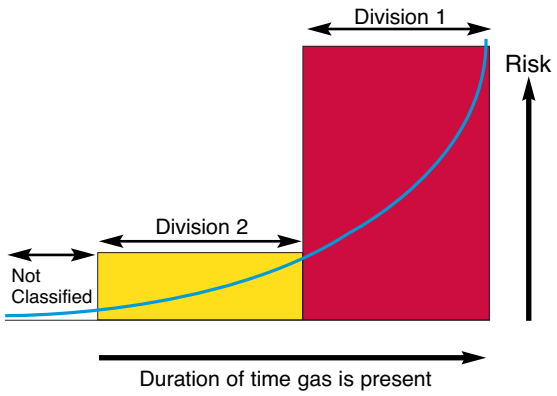
The subdivision of Class I, locations into "**Divisions**" or "**Zones**" is based on the probability that an explosive gas atmosphere may be present in a location. If the risk is extremely low, the location is considered unclassified. A good example of a low risk area is a single family home with natural gas or propane furnace for heating. The gas could, and does on extremely rare occasions, leak into the home, encounter an ignition source and an explosion occurs, usually with devastating results. However, since the risk is so low, because of the safety systems built into the gas supply and heating equipment, these areas are not "hazardous (classified) locations".

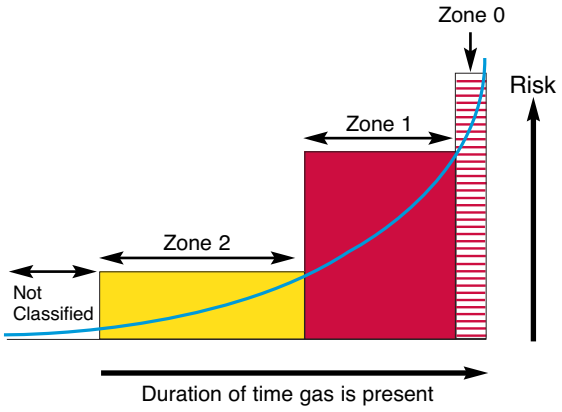
Recent editions of the **NEC**® (National Electrical Code) and **CEC**® (Canadian Electrical Code) have incorporated the international definitions for "Zones" for Class I, locations. The two codes continue to address the "Division" system although the methods are somewhat different.

The frequency of occurrence determines the level of hazard for a location. Simply stated, the longer the material is present, the greater the risk.

Frequency of Occurrence	Division System	Zone System
Continuous	Class I, Division 1	Zone 0
Intermittent Periodically		Zone 1
Abnormal Condition	Class I, Division 2	Zone 2

The charts below compare the Division and Zone systems in terms of risk assessment.





The abnormal conditions of occurrence, or lower risk areas, in the Zone and Division system are basically identical. However, in areas where a hazard is expected to occur in normal operation, the Zone system deals with highest risk areas separately, and risk associated with the remaining location is considered lower. The Division system tends to be less specific in its consideration of Division 1. The Division system treats all areas where a hazard is expected to occur in normal operation the same.

The following chart illustrates the differences between the various Zones.

Grade of Release	Zone	Flammable Mixture Present
Continuous	0	1000 hours per year or more (10%)
Primary	1	Between 10 and 1000 hours per year or more (0.1% to 10%)
Secondary	2	Less than 10 hours per year (0.01% to 0.1%)
Unclassified	-	Less than 1 hour per year (Less than 0.01%)

This is a combination of Tables 2 and 3 from API RP505

The 1-hour per year used in API RP505 is considered to be high by some industry experts. Conservative estimates of this figure should be 0.01 hours per year.

Class I Locations, continued

Class I locations are further divided into Groups based on the explosive properties of the materials present. North America under the Class & Div. System uses four Gas groups while the IEC/CENELEC and the U.S. and Canada under the Zone System use three.

The chart below compares the two systems.

Typical Gas	Class/Division Gas Groups	Zone Gas Groups
Acetylene	A	II C
Hydrogen	B	
Ethylene	C	II B
Propane	D	II A

(The US has added a "IIB + hydrogen" group to address certain construction limitations.)

Class II Locations

Class II locations are those which are hazardous due to the presence of combustible or electrically conductive dusts. The dust must be present in sufficient quantities for a fire or explosion hazard to exist. The fact that there is some combustible dust present does not mean a Class II hazardous location exists.

Class II substances are divided into three groups for similar reasons to those of Class I materials: equipment design and area classification. Class II groups are based on different characteristics than those of Class I, given the requirements for an explosion to occur and the protection methods required for equipment. In Class II locations the ignition temperature, the electrical conductivity, and the thermal blanketing effect of the dust are critical when dealing with heat-producing equipment, such as lighting fixtures and motors. It is these factors which are the deciding factors in determining the Class II groups.

Groups	Type of Material	Examples
E	Metal Dusts	Powdered Metals such as Aluminum or Magnesium
F	Carbonaceous Dusts	Carbon Black, Coal Dust or Coke Dust
G	Agricultural Dusts	Grain, Flour, Sugars, Spices and certain Polymers

(The IEC and NEC 506 have developed Zones for atmospheres containing combustible dusts, which again separates areas in to three Zones 20, 21 and 22.)

Zone 20, 21 and 22 Locations

The IEC/CENELEC and the U.S. introduced the three-Zone system for combustible dust locations. These have not been included in the CEC yet.
The definitions are as follows:

Zone 20 - an area in which a combustible dust, as a cloud, is present continuously or frequently during normal operations in sufficient quantities to produce an explosive mixture.

Zone 21 - an area in which a combustible dust, as a cloud, is likely to occur during normal operations in sufficient quantities to produce an explosive mixture.

Zone 22 - an area in which combustible dust clouds may occur infrequently and persist for only short periods of time or in which accumulations or layers may be present under abnormal conditions.

Class III Locations

Class III locations are those which are hazardous due to the presence of easily ignitable fibers or flyings. However, the material is not suspended in the air in quantities sufficient to produce ignitable mixtures.

Easily ignitable fibers and flyings present a serious fire risk, not normally an explosion hazard. The greater danger with Class III materials is that if a layer forms throughout a facility, an ignition will cause a flash fire which moves at near explosive speeds.

In the Zone System fibers and flyings are treated under Zone 20, 21 and 22.

TEMPERATURE CLASSES

Ignition temperature or auto-ignition temperature (AIT) is the minimum temperature of a surface at which an explosive atmosphere ignites. Flammable vapors and gases can be classified into temperature classes according to their ignition temperature. The maximum temperature of a piece of equipment must always be lower than the ignition temperature of the gas - air mixture or vapor - air mixture in which it is placed. Equipment shall be marked to show the operating temperature or temperature class referenced to a +40°C (+104°F) ambient. The temperature class (T code) is indicated on the manufacturers nameplate and is based on the table below.

AMBIENT TEMPERATURE

The ambient temperature is the surrounding temperature of the environment in which a piece of equipment is installed, whether it is indoors or outdoors. The standard temperature range for equipment design in the Zone system is –20°C to +40°C; and in the Class and Division System -25°C to +40°C for this ranges no ambient temperature marking is required on the product. Electrical equipment that is designed for use in a range of ambient temperature other than stated, the actual ambient temperature range shall be marked on the equipment nameplate.

The R. STAHL product lines, in most cases, exceed the above mentioned temperature requirements. Refer to the appropriate catalog pages for the product-specific **"Ambient Temperature Range"**. Any ranges outside of the above stated ranges are marked on the product nameplate.

North American Temperature Code	IEC/CENELEC/NEC 505 Temperature Classes	Maximum Temperature	
		˚C	˚F
T1	T1	450˚C	842˚F
T2	T2	300˚C	572˚F
T2A	-	280˚C	536˚F
T2B	-	260˚C	500˚F
T2C	-	230˚C	446˚F
T2D	-	215˚C	419˚F
T3	T3	200˚C	392˚F
T3A	-	180˚C	356˚F
T3B	-	165˚C	329˚F
T3C	-	160˚C	320˚F
T4	T4	135˚C	275˚F
T4A	-	120˚C	248˚F
T5	T5	100˚C	212˚F
T6	T6	85˚C	185˚F

Applications requiring product with extreme ambient temperature ranges outside those standard ranges stated under the heading **"Ambient Temperature Range"** are specified under the heading of **"Special Ambient Temperature Range"**. Only products with this additional catalog information can be customized for extreme temperature applications. Please consult factory for your special needs.

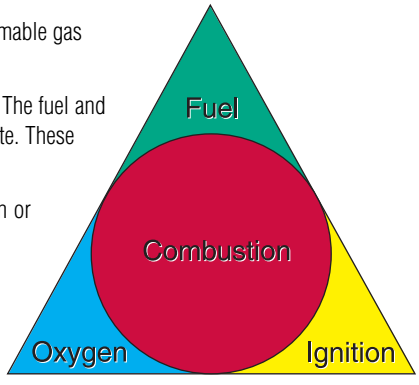
EXPLOSIVE GAS PROTECTION METHODS

There are a number of methods of protecting electrical equipment, which prevent an explosion when used in a flammable gas atmosphere.

Three elements are required for an explosion to occur - fuel, oxygen and a heat or ignition source must be present. The fuel and oxygen must be in the correct mixture. Too little fuel, or a lean mixture, or too much fuel, a rich mixture cannot ignite. These explosive limits are defined as the "Lower Explosive Limit" (LEL) and the "Upper Explosive Limit" (UEL).

Each method of protection addresses the Fire Triangle in some manner. Either by containing an internal explosion or eliminating one or more of the components necessary for an explosion to occur.

The most common North American methods of protection are explosionproof equipment for Class I locations, and dust-ignition proof equipment for Class II locations. R. STAHL produces a wide range of equipment for use in hazardous locations using various methods of protection.



Methods of Protection (Gas)

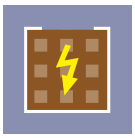
Flameproof Type of Protection "d"- or Explosionproof Equipment

Although the North American term "explosionproof" and IEC term "flameproof" are SIMILAR concepts, the requirements in the product standards are different. Explosionproof is a Div. 1 technology which can be used in a NEC or CEC defined Zone 1 environment. Flameproof is a Zone 1 technology and can not be used in a Div. 1 environment.

Since flammable gases and vapors are expected inside an enclosure, the equipment must be capable of withstanding an explosion caused by sparking contacts of devices, high temperatures, or an electrical fault. The enclosure is designed so that hot gases generated during an internal explosion are cooled below the ignition temperature of the surrounding flammable atmosphere as they escape through the joints of the unit.

In addition, the external surfaces of the enclosure must not become hot enough to ignite the surrounding atmosphere due to heat energy within the unit. This heat energy may be the result of normal operation of heat-producing equipment, or the result of an electrical arc to the enclosure from an arcing ground fault. Safety factors are applied to all testing of this type of enclosure to ensure the unit will not rupture as a result of an internal explosion.

Hazardous Location Overview

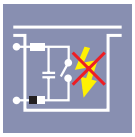


Encapsulation - Type of Protection "ma" for use in Zone 0 and "mb" for use in Zone 1

Encapsulation is a type of protection in which the parts that can ignite an explosive atmosphere are enclosed in a resin. The resin must be sufficiently resistant to environmental influences so that the explosive atmosphere cannot be ignited by either sparking or heating, which may occur within the device. This is typically used with electronic devices.

Increased Safety - Type of Protection "e" or "eb" for use in Zone 1

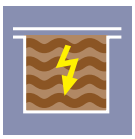
Type of protection applied to electrical equipment that does not produce arcs or sparks in normal service and under specified abnormal conditions, in which additional measures are applied so as to give increased safety against the possibility of excessively high temperatures and of the occurrence of arcs and sparks.



Intrinsic Safety - Types of Protection "i", "ia", "ib" and "ic"

North America now identifies four versions of this protection method. Types "i" (NEC 504) and "i_a" (NEC 505) are identical since type "i" is based on the IEC 60 079-11 Standard. In Zone 0 the only acceptable type of equipment are types "i" and "i_a". Type "i_b" is acceptable in Zone 1 and "i_c" is acceptable in Zone 2

(For further details refer to R. STAHL INC's Catalog for Hazardous Location Automation Products.)



Oil Immersion - Type of Protection "o" or "ob" for use in Zone 1

Type of protection where electrical equipment is immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

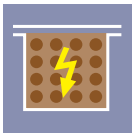
Pressurization - Types of Protection "px" or "pxb" for use in Zone 1, "py" or "pyb"for use in Zone 1 and "pz" or "pzc" for use in Zone 2

This type of protection prevents the surrounding atmosphere from entering an enclosure by maintaining a positive pressure within the unit. Clean air or inert gas is used to maintain a higher pressure than the surrounding atmosphere. In pressurization, the electrical equipment is interlocked with a system which cycles clean air within the unit to remove explosive gases before start up.

Purged and Pressurized -

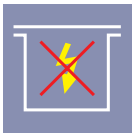
For the Class and Division System the following table applies

Type	Explanation
X	Changes the area within the unit from Class I, Division 1 to unclassified
Y	Changes the area within the unit from Class I, Division 1 to Class I, Division 2
Z	Changes the area within the unit from Class I, Division 2 to unclassified



Powder Filling - Type of Protection "q" or "qb" for use in Zone 1

Type of protection where electrical parts capable of igniting an explosive atmosphere are fixed in position and completely surrounded by filling material (glass or quartz powder) to prevent the ignition of an external explosive atmosphere.



Nonsparking Equipment - Type of Protection "nA" or "nAc" for Use in Zone 2

Sparking Equipment - Type of Protection "nC" or "nCc" for Use in Zone 2

Equipment in which the contacts are suitably protected other than by restricted breathing enclosure.

Hermetically Sealed for use in Class I, Division 2 or Zone 2

A common type of hermetically sealed equipment is a contact block or reed switch. In this method, the arcing components of the switch are encased in a glass tube. The connecting wires are fused to the glass sealing the unit to prevent any ingress of flammable gases.

Restricted Breathing Enclosure - Type of Protection "nR" or "nRc" for Use in Zone 2

Combustible Dust Protection Methods

CLASS II EQUIPMENT

Dusttight equipment is designed to exclude dust from entering the enclosure, to prevent hot particles, arcs, sparks or heat generated inside of the enclosure from igniting an exterior accumulation or atmospheric suspension of dusts on or in the vicinity of the enclosure. Nonmetallic enclosures must also prevent the accumulation of static charges on the enclosure itself.

The primary function of the joints of these enclosures is to seal dust out and keep the hot particles etc. inside, therefore, typically the joints are gasketed.

Since this protection method keeps the combustible dusts outside, the enclosure is not expected or designed to contain an internal explosion. The design must be sufficient though to withstand mechanical abuse.

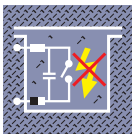
The ignition temperature of dusts is usually lower than that of gases and vapors, and therefore the control of external surface temperatures is more rigorous for Class II equipment than for Class I equipment. Dust layers on the equipment can act as insulation for the heat generated inside the equipment, which in turn can increase the surface temperature of the unit even under normal operating conditions.

The NEC defines "Dust-ignition proof" as the protection for Class II, Division 1 and 2 locations for which it is approved, and "Dusttight" as a type of enclosure that is constructed so that dusts will not enter the enclosing case under specific test conditions. In the NEC, some applications for Class II, Division 1 require Dust-ignition proof enclosures.

The NEC, in Article 506 introduced the Zone Classification System, Zones 20, 21 and Zone 22 for Combustible Dust or Ignitible Fibers and Flyings, as an alternative to the Class and Division Classification System covered in Articles 500, 502 and 503.

The Zone Classification System is based on the modified IEC Area Classification System as defined in ANSI/ISA 61241-10.

Methods of Protection (Dust)

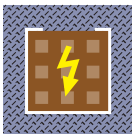


Intrinsic Safety - Type of Protection iaD for Zone 20, 21 and 22

Intrinsic Safety - Type of Protection ibD for Zone 21 and 22

Associated Apparatus - Type of Protection [iaD] - Unclassified

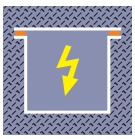
Associated Apparatus - Type of Protection [ibD] - Unclassified



Encapsulation - Type of Protection maD for Zone 20, 21 and 22

Encapsulation - Type of Protection mbD for Zone 21 and 22

Pressurization - Type of Protection pD for Zone 21 and 22



Enclosure - Type of Protection tD for Zone 21 and 22

Environmental Protection

NEMA and CSA Type Enclosure

NEMA or CSA Type 1 Enclosures are intended for indoor use primarily to provide a degree of protection against limited amounts of falling dirt. This type is not specifically identified in the CSA Standard.

NEMA or CSA Type 2 Enclosures are intended for indoor use primarily to provide a degree of protection against limited amounts of falling water and dirt.

NEMA or CSA Type 3 Enclosures are intended for outdoor use primarily to provide a degree of protection against rain, sleet, windblown dust; and damage from external ice formation.

NEMA or CSA Type 3R Enclosures are intended for outdoor use primarily to provide a degree of protection against rain, sleet; and damage from external ice formation, and must have a drain hole.

NEMA or CSA Type 3S Enclosures are intended for outdoor use primarily to provide a degree of protection against rain, sleet, windblown dust; and to provide for operation of external mechanisms when ice laden.

NEMA or CSA Type 4 Enclosures are intended for indoor or outdoor use primarily to provide a degree of protection against windblown dust and rain, splashing water, hose directed water; and damage from external ice formation.

NEMA or CSA Type 4X Enclosures are intended for indoor or outdoor use primarily to provide a degree of protection against corrosion, windblown dust and rain, splashing water, hose directed water; and damage from external ice formation.

NEMA or CSA Type 5 Enclosures are intended for indoor use primary to provide a degree of protection against settling airborne dust, falling dirt, and dripping non-corrosive liquids.

NEMA or CSA Type 6 Enclosures are intended for indoor or outdoor use primarily to provide a degree of protection against hose-directed water, the entry of water during occasional temporary submersion at a limited depth; and damage from external ice formation.

NEMA or CSA Type 6P Enclosures are intended for indoor or outdoor use primarily to provide a degree of protection against hose-directed water, the entry of water during prolonged submersion at a limited depth; and damage from external ice formation.

NEMA or CSA Type 12 Enclosures are intended for indoor use primarily to provide a degree of protection against circulating dust, falling dirt, and dripping non-corrosive liquids.

NEMA or CSA Type 12K Enclosures with knockouts are intended for indoor use primarily to provide a degree of protection against circulating dust, falling dirt, and dripping non-corrosive liquids.

NEMA or CSA Type 13 Enclosures are intended for indoor use primarily to provide a degree of protection against dust, spraying of water, oil, and non-corrosive coolant.

Definitions Referring To NEMA Requirements for Hazardous Location

The following NEMA type enclosures occasionally appear on specifications and product literature

NEMA 7 Enclosures are intended for indoor use in locations classified as Class I, Groups A, B, C, or D, as defined in the NEC.

NEMA 8 Enclosures are for indoor or outdoor use in locations classified as Class I, Groups A, B, C, or D, as defined in the NEC.

NEMA 9 Enclosures are intended for indoor use in locations classified as Class II, Groups E, F, and G, as defined in the NEC.

.

NEMA 10 Enclosures are constructed to meet the applicable requirements of the Mine Safety and Health Administration. (MSHA)

The designations are considered to be historical terminology approaching obsolescence and are incomplete designations at best. Types 7 and 9 are not mentioned anywhere in the National Electrical Code, the controlling document for installations. All hazardous location products must be marked with the Class, Division, Group, and Temperature Class to provide to an installer all of the information needed to complete an installation in accordance with Article 500 of the National Electrical Code.

Comparison of Specific Applications of Enclosures for Indoor Unclassified Locations

Provides A Degree Of Protection Against The Following Environmental Conditions	Type of Enclosure									
	1*	2*	4	4x	5	6	6P	12	12K	13
Incidental contact with the enclosed equipment	x	x	x	x	x	x	x	x	x	x
Falling dirt	x	x	x	x	x	x	x	x	x	x
Falling liquids and light splashing	-	x	x	x	x	x	x	x	x	x
Circulation dust, lint, fibers, and flyings**	-	-	x	x	-	x	x	x	x	x
Settling airborne dust, lint, fibers, and flyings**	-	-	x	x	x	x	x	x	x	x
Hosedown and splashing water	-	-	x	x	-	x	x	-	-	-
Oil and coolant seepage	-	-	-	-	-	-	-	x	x	x
Oil and coolant spraying and splashing	-	-	-	-	-	-	-	-	-	x
Corrosive agents	-	-	-	x	-	-	-	-	-	-
Occasional temporary submersion	-	-	-	-	-	x	x	-	-	-
Occasional prolonged submersion	-	-	-	-	-	-	-	-	-	-

* These enclosures may be ventilated. However, Type 1 may not provide protection against small particles of falling dirt when ventilation is provided in the enclosure top.

** These fibers and flyings are not explosive materials and are not considered as Class III type ignitable fibers or combustible flyings. For Class III type ignitable fibers or combustible flyings see the National Electrical Code®, Article 500.

Comparison of Specific Applications of Enclosures for Outdoor Unclassified Locations

Provides A Degree Of Protection Against The Following Environmental Conditions	Type of Enclosure						
	3*	3R***	3S	4	4X	6	6P
Incidental contact with the enclosed equipment	x	x	x	x	x	x	x
Rain, snow, sleet*	x	x	x	x	x	x	x
Sleet**	-	-	x	-	-	-	
Windblown dust	x	-	x	x	x	x	
Hosedown	-	-	-	x	x	x	
Corrosive agents	-	-	-	-	x	-	
Occasional temporary submersion	-	-	-	-	-	x	
Occasional prolonged submersion	-	-	-	-	-	-	x

* External operating mechanisms are not required to operate when the enclosure is ice covered.

** External operating mechanisms are operable when the enclosure is ice covered.

***These enclosures may be ventilated.

Comparison of Specific Applications of Enclosures for Indoor Hazardous (Classified) Locations

Provides a Degree of Protection Against Atmospheres Typically Containing Hazardous Gases, Vapors, and Dusts***	Type of Enclosure: NEMA 7 & 8, Class I Groups**					NEMA 9 & 10, Class II Groups**			
	Class	A	B	C	D	E	F	G	10
Acetylene	I	x	-	-	-	-	-	-	-
Hydrogen, manufactured gases	I	-	x	-	-	-	-	-	-
Diethyl ether, ethylene, cyclopropane	I	-	-	x	-	-	-	-	-
Gasoline, hexane, butane, naphtha, propane, acetone	I	-	-	-	x	-	-	-	-
Toluene, isoprene	I	-	-	-	x	-	-	-	-
Metal dusts	II	-	-	-	-	x	-	-	-
Carbon black, coal dust, coke dust	II	-	-	-	-	-	x	-	-
Flour, starch, grain dust	II	-	-	-	-	-	-	x	-
Fibers, flyings	III	-	-	-	-	-	-	-	-
Methane with or without coal dust	MSHA	-	-	-	-	-	-	-	x

* Due to the characteristics of the gas, vapor, or dust, a product suitable for one Class or Group may not be suitable for any other Class or Group unless so marked on the product.

** For Class III type ignitable fibers or combustible flyings refer to the National Electrical Code® Article 500.

***For a complete listing of flammable liquids, gases, or vapors refer to NFPA 497 - 1997 (Recommended Practice for the Classification of Flammable Liquids. Gases, or Vapors and of Hazardous (Classified) Locations for Electrical installations in Chemical Process Areas and NFPA 325 - 1994 (Fire Hazard Properties of Flammable Liquids. Gases, and Volatile Solids). Reference also NFPA 499 -1997 Classifications of Combustible Dusts and of Hazardous (Classified) Locations for Electrical installations in Chemical Process Areas.

Ingress Protection (IP)

The IEC uses the term “Ingress Protection” to identify the environmental protection of a device.

This is defined in IEC Standard 60 529 and the following chart illustrates the two-digit code used.

IP The IP classification system designates, by means of a number, the degree of protection provided by a device against ingress of dust and water.		**SECOND NUMBER** Degree of protection against water	
		0 	Non-protected.
FIRST NUMBER Degree of protection against solid objects		1 	Protected against water dripping vertically, such as condensation.
0 	Non-protected.	2 	Protected against dripping water when tilted up to 15°.
1 	Protected against a solid object greater than 50mm such as a hand.	3 	Protected against water spraying at an angle of up to 60°.
2 	Protected against a solid object greater than 12mm, such as a finger.	4 	Protected against water splashing from any direction.
3 	Protected against a solid object greater than 2.5mm, such as wire or a tool.	5 	Protected against jets of water from any direction.
4 	Protected against a solid object greater than 1.0 mm, such as wire or thin strips.	6 	Protection against heavy seas or powerful jets of water.
5 	Dust-protected. Prevents ingress of dust sufficient to cause harm.	7 	Protected against harmful ingress of water when immersed between a depth of 150mm to 1 meter.
6 	Dust tight. No dust ingress.	8 	Protected against submersion. Suitable for continuous immersion in water.

EQUIPMENT CERTIFICATION

Equipment for use in hazardous locations must be certified to an appropriate National Standard and marked as such by an accredited third party testing organization. Follow-up inspection to ensure conformance is part of the program. Products may carry multiple markings for multiple countries. The following is a brief description of the National Requirements.

Important Listing Information

The specific requirements for product certification vary from country to country. While UL, FM and CSA are similar in their approach, subtle differences still exist.

North American certifications permit conduit or cable entries to be field installed provided appropriate bonding and grounding requirements are followed.

Marking

Typical North American Marking to NEC 500

Class I, Divisions 1 or 2, Groups A, B, C & D, T4 (T-Code)
Class II, Divisions 1 or 2, Groups E, F & G, T4 (T-Code)
Class III,
Enclosure Type 3, 4, 4X

Typical U.S. Marking to NEC 505

Class I, Zone 1, AEx de IIC T6

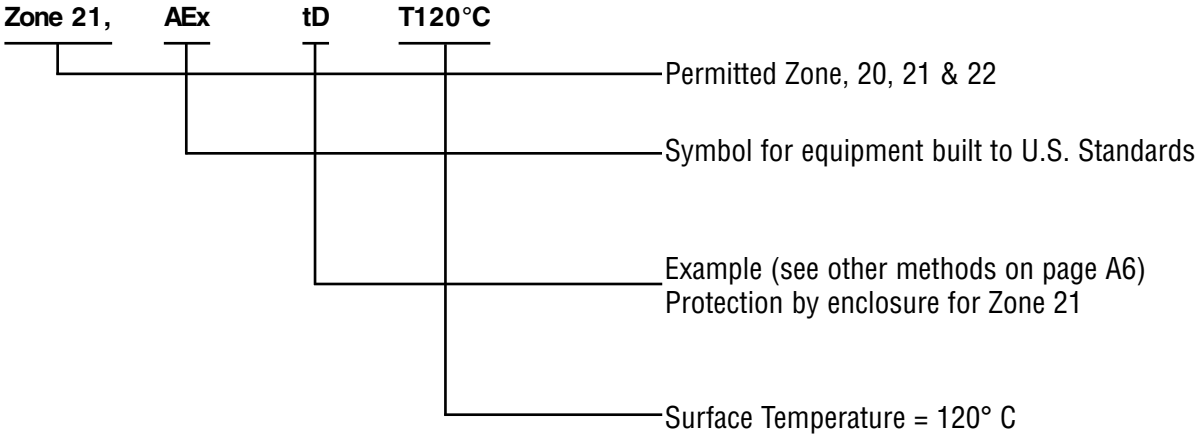
- Class I (Gases and Vapors)
  - Zone 0 Areas where explosive gas atmosphere is **continuously** present or present for long periods of time
  - Zone 1 Areas where explosive gas atmosphere is **likely to occur** in normal operation or can be expected to be present frequently
  - Zone 2 Area where explosive gas atmosphere is **not likely to occur** and if it does, it will only exist for a short period of time
- AEx designates built to a US ANSI standard
- Methods of protection, d, e, p, i, o, q, m, n
- Apparatus Group
  - II Surface Industries
    - A (propane)
    - B (ethylene)
    - C (hydrogen)
- Temperature Class
  - T1 450° C
  - T2 300° C
  - T3 200° C
  - T4 135° C
  - T5 100° C
  - T6 85° C

Equivalent Canadian Marking would read

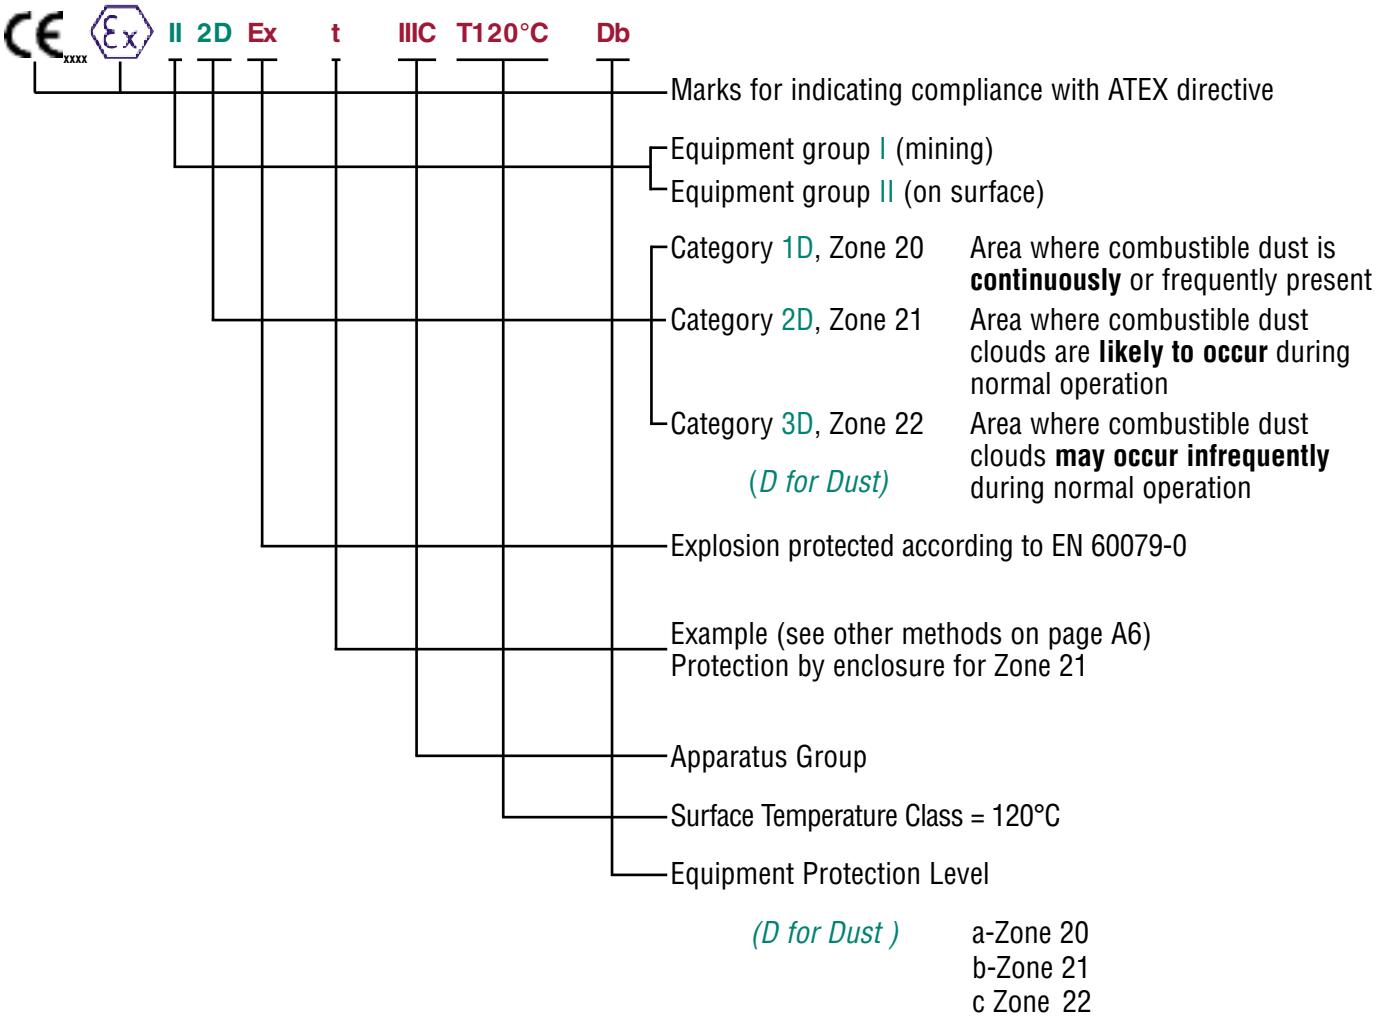
Ex de IIC T6

Typical U.S. Marking to NEC 506

(Dust Zones not adopted by Canada yet)



Typical European ATEX/CENELEC Marking for Dust Explosion Protection



Typical European ATEX/CENELEC Marking for Gas Explosion Protection

Marks for indicating compliance with ATEX directive

Equipment group I (mining)
Category M1 and M2

Equipment group II (on surface)

Category 1G, Zone 0 — Areas where explosive gas atmosphere is **continuously** present or present for long periods of time

Category 2G, Zone 1 — Areas where explosive gas atmosphere is **likely to occur** in normal operation or can be expected to be present frequently

Category 3G, Zone 2 — Area where explosive gas atmosphere is **not likely to occur** and if it does, it will only exist for a short period of time

(G for Gas)

Explosion protected according to standards EN 60079…

Methods of protection, d, e, p, i, ia, ib, ic, o, q, m, ma, mb, n

Apparatus Group
I Mining - Underground (methane)
II Surface Industries
A (propane)
B (ethylene)
C (hydrogen)

Temperature Class
T1 450° C
T2 300° C
T3 200° C
T4 135° C
T5 100° C
T6 85° C

ATEX DIRECTIVE

The ATEX Directive 94/9/EC is a directive adopted by the European Union (EU) to facilitate free trade in the EU by aligning the technical and legal requirements in the Member States for products intended for use in potentially explosive atmospheres.

This Directive applies to electrical and non-electrical equipment/components and protective systems. The ATEX Directive became mandatory on July 1, 2003.

Equipment located outside potentially explosive atmospheres are also covered by the ATEX Directive under the following conditions:

- The equipment is a safety device, controller or regulatory device; and
- The equipment is required for the safe function of equipment or protective systems with respect to the risk of explosion.

All equipment under its scope is required to bear the European CE Marking as verification of compliance with the Directive (the CE Marking will not appear on components defined by this Directive). The ATEX Directive specifically defines procedures for the evaluation of a product's design and production based on Equipment Groups and Categories. This is briefly outlined below.

Equipment Group I Overview

Equipment intended for use in underground parts of mines, and to those parts of surface installations of such mines, liable to be endangered by firedamp and/or combustible dust.

Equipment Category	Protection	Comparison To Current IEC Classification
M1	2 levels of protection; or 2 independent faults	Group I
M2	1 level of protection based on normal operation	Group I

Equipment Group II Overview

Equipment intended for use in other than Equipment Group I places that are liable to be endangered by explosive atmospheres.

Equipment Category	Protection	Comparison To Current IEC Classification
1G 1D	2 levels of protection; or 2 independent faults	Group II, Zone 0 (gas) Zone 20 (dust)
2G 2D	1 level of protection based on frequent disturbances; or equipment faults	Group II, Zone 1 (gas) Zone 21 (dust)
3G 3D	1 level of protection based on normal operation	Group II, Zone 2 (gas) Zone 22 (dust)

ATEX Marking

The equipment for ATEX identifies the category which indicates a risk of the equipment becoming a source of ignition. The table at right shows the relationship between Categories and Zones. Note that the Zone represents only the risk of a release of flammables into the area.

NOTE: As an alternative to the relationship given in the table at right between Categories and Zones, the required Category of equipment may be selected on the basis of risk, i.e. taking into account the consequences of an ignition. This may, under circumstances, require a higher Category or permit a lower Category than defined in the table.

Zone	Categories
0	1G
1	2G
2	3G
20	1D
21	2D
22	3D

Differences Between the Old and New Directives

The main differences are:

- The inclusion of non-electrical equipment
- The inclusion of dust atmospheres
- Additional quality system requirements
- The need to produce a 'Technical File'
- Requirements for safety related devices (flame arrestors, suppression systems etc) and safe area equipment

Products Covered

The Directive includes equipment and safety or control devices installed outside the potentially explosive area but having an explosion protection function. A wide range of products comes within the definition of equipment, including electric motors, compressors, diesel engines, lighting fittings, control and communication devices and monitoring and detection equipment, to name but a few. "Protective Systems" are also included, and include items that prevent an explosion that has been initiated from spreading or causing damage. They include flame arrestors, quenching systems, pressure relief panels and fast-acting shut-off valves to name but a few.

Product Exclusions

The Directive, however, does exclude the following product types:

- Medical devices
- Products for use in the presence of explosives
- Products for domestic use
- Means of transport by air or on road or rail or water networks. Vehicles intended for use in an explosive atmospheres are not excluded.
- Sea-going vessels and mobile offshore units
- Military equipment
- Personal protective equipment covered by directive 89/686/EEC

For more info about ATEX, visit http://ec.europa.eu/enterprise/ATEX/index_en.htm

CE MARKING

The CE mark is a mandatory European marking for certain product groups to indicate conformity with the essential health and safety requirements set out in European Directives. The letters 'CE' are an abbreviation of Conformité Européenne, French for European conformity. The CE mark must be affixed to a product if it falls under the scope of the so called 'New Approach' Directives. Without the CE marking, and thus without complying with the provisions of the Directives, the product may not be placed in the market or put into service in the fifteen member states of the European Union and Norway, Iceland and Liechtenstein. However, if the product meets the provisions of the applicable European Directives, and the CE mark is affixed to a product, these countries may not prohibit, restrict or impede the placing in the market or putting into service of the product. Thus, CE marking can be regarded as the products trade passport for Europe. For more info about CE marking, visit www.eurunion.org/legislat/standard/standard.htm

IECEx SCHEME

The objective of the IECEx Scheme is to facilitate global trade in electrical equipment intended for use in explosive atmospheres by eliminating the need for multiple national certification.

The IECEx Scheme provides the means for manufacturers of Ex equipment to obtain certificates of conformity that will be accepted at national level in all participating countries. A certificate of conformity may be obtained from any certification body accepted into the Scheme. The certificate will attest that the equipment design conforms to the relevant IEC Standards. The final objective of the IECEx Scheme is world-wide acceptance of one standard, one certificate and one mark.

For the IECEx Scheme to achieve its long term objective, every national Standard for which application is made by participating countries will need to be identical to the corresponding IEC Standard. For countries whose national Standards are not yet identical to the IEC Standards, a transitional period will be necessary to allow time for participating IECEx Scheme member countries to adjust their national standards to the IEC standards and work toward national acceptance of IECEx Certificates of conformity and the IECEx mark.

For more info about IECEx Scheme, visit www.IECEx.com

–20°C (–4°F) Min.

Supply Voltage 120 to 277V, ac/dc

FEATURES

The EXLUX 6000 Series of Luminaires are designed for hostile and hazardous locations where reliability and rugged performance are critical. The housing is constructed of heavy-duty fiberglass reinforced polyester (FRP) with a single piece, low glare polycarbonate lens.

The EXLUX 6000 Series is supplied with electronic ballasts which are designed to eddition 4 of IEC 60079-7 Annex H for controll of the “End of Life” of the lamps. They are available in 17, 32 and 40-Watts one or two-lamp versions. The appropriate lamps are standard T8 medium bipin. The luminaires also come with a cover interlock switch which automatically de-energizes the luminaires when opening for relamping. They also are available in either dead-end or feed-through wiring. The ballasts are self-contained flameproof enclosures with increased safety terminals for the highest degree of safety.

INSTALLATION

The luminaire includes threaded NPT openings with grounded back plates and NPT close-up plugs. For MC-HL cable installation use TMC cable glands.

For conduit installation use conduit hubs 8166/11-0•-N (See Page B7).

Supply Voltage 120V, 50-60Hz

Ambient Temperature Range:

AC & Battery Operation +50°C (+122°F) Max.
–20°C (–4°F) Min.
Charging & Test Operation +50°C (+122°F) Max.
–5°C (+23°F) Min.

FEATURES

The EXLUX 6008 Series carries out pre-programmed testing schedules, monitors emergency ballast performance and battery charging. In case of power failure the Auto-testing Emergency Ballast automatically switches to emergency mode, keeping one lamp illuminated at reduced lumen output for a minimum of 90 minutes. When AC power is restored, the luminaire returns to AC supply. The EXLUX 6008 Series of Emergency Luminaires are designed for hostile and hazardous locations where reliability and rugged performance are critical. The housing is constructed of fiberglass reinforced polyester (FRP) with a single piece, low glare polycarbonate lens. They are supplied with flameproof electronic ballasts as standard, which are designed to eddition 4 of IEC 60079-7 Annex H for controll of the "End of Life" of the lamps. The luminaires also come with a cover interlock switch which automatically de-energizes the luminaires when opening for relamping.

INSTALLATION

The luminaire includes threaded NPT openings with grounded back plates and NPT close-up plugs. For MC-HL cable installation use TMC cable glands. For conduit installation use conduit hubs 8166/11-0•-N (see page B7). The luminaire must be wired with a permanent charging phase which needs to be the same potential as the switched phase. The terminal capacity is 2 stranded wires 10 AWG per terminal.

PERIODIC AUTO TESTING

The luminaire automatically performs a weekly functional test and a discharge test which is performed every six months.

STATUS INDICATOR DISPLAY

One red LED and one green LED are incorporated into the luminaire and can be seen from the outside through the lens. The functions and test results are listed on this page.

FEATURES

The EXLUX 6400 Series of Luminaires are designed for hostile and hazardous locations where reliability and rugged performance are critical. The housing is constructed of heavy-duty fiberglass reinforced polyester (FRP) with a single piece, low glare polycarbonate lens.

The EXLUX 6400 Series is supplied with electronic instant-start ballasts as standard and is available in 17, 32 and 40-watts one or two-lamp versions. The two-lamp versions are dual channel, which keeps the luminaire functional should one lamp fail. The luminaires also come with a cover interlock switch which automatically de-energizes the luminaires when opening for relamping. The power factor is ≥ .99. The electronic ballast meets ANSI C82.11 standards regarding harmonic distortion.

INSTALLATION

The luminaire includes threaded NPT openings with grounded back plates and NPT close-up plugs. For MC Cable installation use TMC cable glands.

For conduit installation use conduit hub 8166/11-0•-N (See Page B7).

The appropriate lamps are standard T8 medium bipin lamps.

Supply Voltage Range from 120V, to 277V, 60 Hz

FEATURES

The EXLUX 6408 Series of Emergency Luminaire is equipped with one high temperature, maintenance free, nickel-cadmium battery back-up unit with a life expectancy of 7–10 years. In case of power failure it automatically switches over to battery supply keeping one lamp illuminated at reduced lumen output for a minimum of 90 minutes. When AC power is restored, the luminaire returns to AC supply. When the Red LED indicating light is illuminated the battery is being charged or monitored. It is visible from the outside through the lens.

The EXLUX 6408 Series is also supplied with an AC electronic instant start ballast unit and is available in 2 x 17W or 2 x 32W parallel lamps. This keeps the luminaire functional should one lamp fail. The luminaires also come with a cover interlock switch which automatically de-energizes the luminaires when opening for relamping. The power factor is ≥ .99. The electronic ballast meets ANSI C82.11 standards regarding harmonic distortion.

The EXLUX 6408 Series are designed for hostile and hazardous locations where reliability and rugged performance are critical. The housing is constructed of heavy-duty fiberglass reinforced polyester (FRP) with a single piece, low glare polycarbonate lens.

INSTALLATION

The luminaire includes threaded NPT openings with grounded back plates and NPT close-up plugs. For MC Cable installation use TMC cable glands. For conduit installation use conduit hub 8166/11-0•-N (See Page B7).

The luminaire must be wired with a permanent charging phase which needs to be the same potential as the switched phase.

The appropriate lamps are standard T8 medium bipin lamps.

FEATURES

The ECOLUX 6600 Series of Luminaires are designed for hostile and hazardous locations where reliability and rugged performance are critical. The housing is constructed of heavy-duty fiberglass reinforced polyester (FRP) with a single piece, low glare polycarbonate lens.

The ECOLUX 6600 Series is supplied with electronic instant-start ballasts as standard and is available in 17, 32 and 40-Watts, one or two-lamp versions. The two-lamp versions are dual channel, which keeps the luminaire functional should one lamp fail. The power factor is ≥ .99. The electronic ballast meets ANSI C82.11 standards regarding harmonic distortion.

INSTALLATION

The luminaire includes threaded NPT openings with grounded back plates and NPT close-up plugs. For MC Cable installation use TMC cable glands.

For conduit installation use conduit hub 8166/11-0•-N (See Page B11).

The appropriate lamps are standard T8 medium Bipin lamps.

FEATURES

- Power Factor 0.9 (compensated)
- Cast copper-free aluminum housings and mounting covers with polyester powder finish provide excellent corrosion resistance
- Heat and impact resistant internally fluted glass
- Wide range of light sources and wattages to meet specifiers' needs
- All external hardware is stainless steel for maximum corrosion resistance
- Polyester powder coated aluminum guards offer maximum impact protection for tempered glass globes
- Dome fiberglass reinforced polyester reflectors
- Easy, "hands free" access for wiring, maintenance and relamping

HOUSING MATERIAL
Fiberglass Reinforced Polyester (FRP) with recessed gasket.

Application
The 8040/73 Series of light switches are 16 Amp rotary switches that come in either ON-OFF or as THREE-WAY types to switch lighting circuits from two different locations.

There is also the 8040/84 Series available with a two-gang enclosure which allows for one conduit run and **two** of the above mentioned switches.

Ready-Term® 8150 Terminal Boxes

ADVANTAGES OF THE SERIES 8150

The new form of the edges allows quick water drainage and prevents water from accumulating around the gasket.
This solution helps to increase the safety inside the enclosure.

The flange plate mounted from the outside is another advantage of this enclosure:
This guarantees a perfect accessibility - even if the cables are already built-in.

The large beam width allows you a comfortable access and an easy and fast handling.

If a regular access is required, the version equipped with a sash lock (or a hinge) is recommended.

The enclosure comes with an external ground connection.

8125 Series Terminal Boxes

Ready-Term®
8125 Terminal Boxes Features:

- *Pre-Configured with terminals mounted*
- *Materials: Stainless Steel or Carbon Steel*
- *Six enclosure sizes with different depths*
- *For power and control circuits*
- *For I.S. circuits with blue terminals*
- *Entry hardware optional*
- *Field installation possible*

Ready-Term® 8125 Terminal Boxes

PRE-CONFIGURED STAINLESS AND CARBON STEEL TERMINAL BOXES WITH PHOENIX TERMINALS

FEATURES

The Ready-Term® 8125 Series of terminal boxes are made of 316 stainless sheet steel or painted carbon steel. They offer a one-source solution to the time-consuming process of providing ready to install terminal boxes for hazardous locations. With its single part number solution, the Ready-Term® 8125 Series eliminates the inconvenience of purchasing the enclosure and individual parts. This Series is supplied with the indicated quantity of individually numbered terminals for each size of enclosure, fully certified and ready to be installed.

Ready-Term® 8125 Terminal Boxes

PRE-CONFIGURED STAINLESS AND CARBON STEEL TERMINAL BOXES WITH PHOENIX TERMINALS

In addition to the various North American applications, this Series is PTB certified for use in Zones 1 and 2. The design conforms to CENELEC EN/IEC 60 079-7 and many others. Consult factory.

APPLICATION

Typical applications include junction boxes for petrochemical plants, waste treatment facilities, oil refineries and other major industrial plants. As a product with certifications recognized globally, the Ready-Term® 8125 Series is well suited for original equipment manufacturers who market throughout the world.

The 8125/1 Series of terminal boxes is intended for use on circuits designed for power and motor control applications.

The 8125/2 Series is intended for use with intrinsically safe circuits. These enclosures are outfitted with blue terminals to provide an indication to field personnel that the circuits are intrinsically safe and should not be confused with non-intrinsically safe circuits.

These enclosures make it necessary for the metal entry hardware to be bonded to the ground system. Use the suitable 8166/11 conduit hubs specified in the hub table on page C15.

Custom enclosures can be configured upon request. The following modifications are available:

- Stainless Steel hinges for right or left side (specify)
- Conduit hubs 8166/11 (specify)
- Cable glands (specify)
- Close-up plugs (specify)
- Flange plates (specify)
- Screw-Type Terminals up to 600MCM
- Cage Clamp Terminals up to 8AWG

8125 Series Terminal Boxes

INSTALLATION OF ENTRY HARDWARE

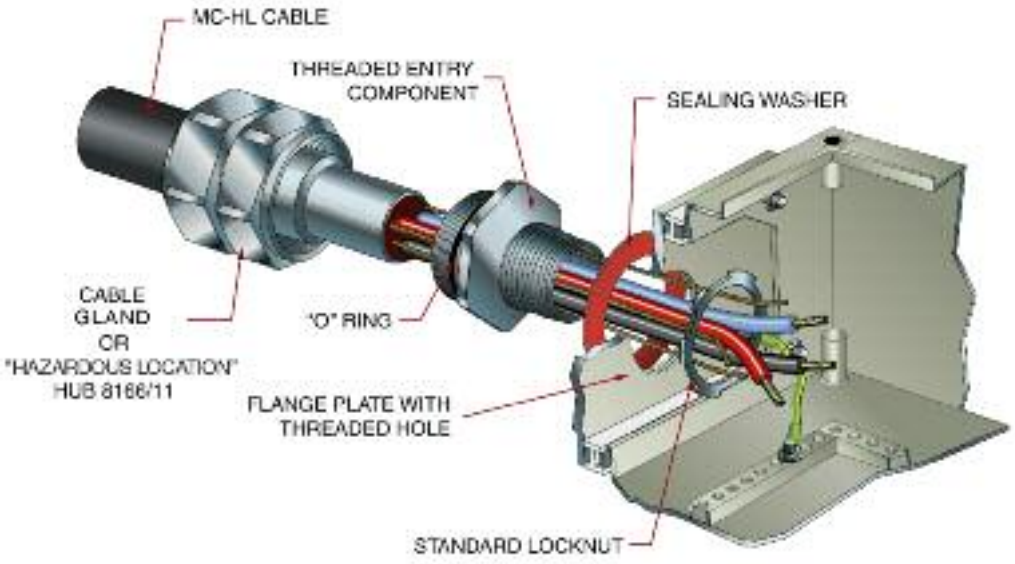
The 8125 Series of metallic terminal boxes are available with factory installed conduit hubs for conduit installation or with cable glands for cable installation.

Approved and suitable for the location entry hardware can also be field installed.

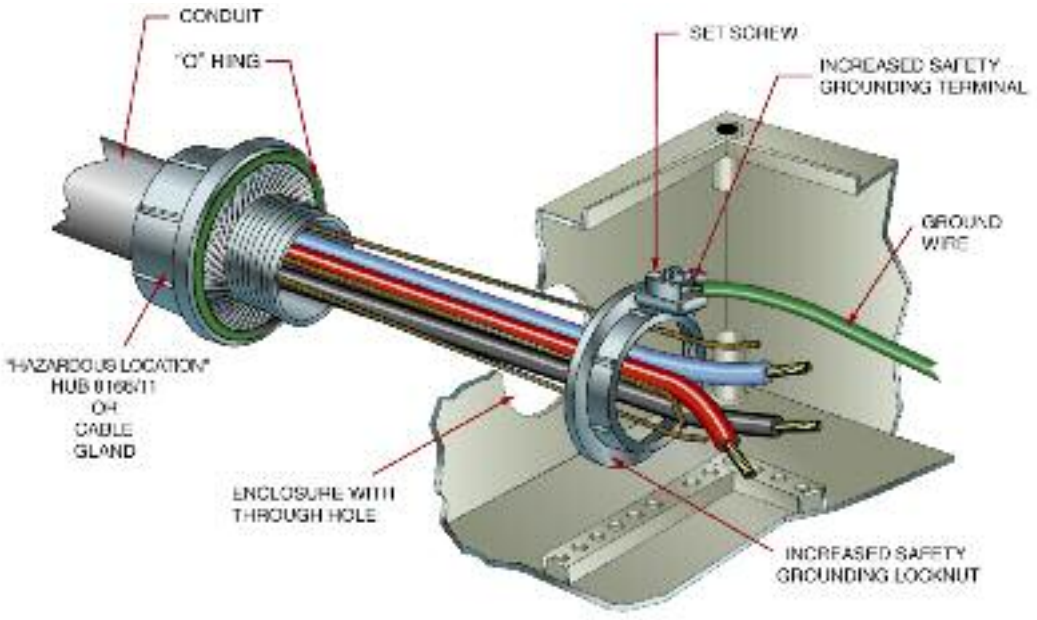
These enclosures make it necessary for the metal cable glands or conduit hubs to be bonded to the ground system. This can be accomplished by installing enclosures with flange plates according to Method 1 (shown on the upper half of this page), or enclosures without flange plates according to Method 2 (shown on the lower half of this page).

For cable glands see section J.

Method 1: Enclosures with flange plates using threaded openings through the flange plate and standard locknuts. Flange plates must be connected to the internal grounding system using jumper wires.



Method 2: Enclosures without flange plates using a hole 'through the enclosure' with an "increased safety" grounding locknut.



These locknuts must be bonded between each other and to the grounding system using a jumper wire.

After the entry hardware is installed, connect the appropriate conduit or cable.

Table for max. numbers of entry openings either installed with conduit hubs 8166/11 or cable glands (see page C18).

CAUTION:
The max. possible number of entries which can be installed on the sides of the enclosures depends on the number of terminal columns installed. With horizontally installed columns, there are no side entries possible or only limited, depending on enclosure size. With vertically installed columns there are no bottom or top entries possible, or only limited, depending on enclosure size.

Electrical Capacity Tables
(only applicable for Class I, Zone 1)

In Class I, Zone 1 hazardous (classified) areas, heat produced by current in the wire inside an enclosure is a concern. Therefore, the continuous current of each current carrying conductor, the quantity and the size of the conductors inside a terminal enclosure needs to be limited. For each enclosure size, there is one table which shows the permissible values for that particular terminal enclosure.

How to use the electrical capacity tables:

- Determine the enclosure type you are dealing with.
- Reference the applicable electrical capacity table printed on pages C46-C49.

In the white area of the table the permitted numbers of current carrying conductors inside the enclosure are indicated (in and out counts two wires) depending on wire size and continuous current.

In the green shaded area of the table additional conductors/terminals are permitted up to the space limit of the enclosure. (see catalog pages C39 & C40)

In the area with red diagonal lines of the table no conductors/terminals are permitted.

Jumper links and ground wires can be neglected, in calculating the number of wires. These can be added whenever necessary.

EXAMPLE:

Enclosure type: 8125/1061-2DP-10021(see page C39).

The maximum physical quantity of terminals 30-10 AWG for this enclosure is 21.

Reference the table 8125/1061 on page C46, you will find that 18 wires 10 AWG with 30 Amps continuous current is the thermal limit of this enclosure.

Conclusion: To terminate 18 wires 9 terminals are needed, terminating two wires per terminal only. The remaining 12 terminals (21- 9 =12) can be used for low amperage circuits in the green shaded area of the table. Jumper links and ground wires can be neglected.

Mixed circuits of different wire sizes and current values are possible by applying the table values proportionally

i.e. enclosure table 8125/1061.

Wire Size AWG	Current Amps	Number of Current Carrying Conductors		Proportion
		Permissible	Actual	
12	20	24	12	50%
10	30	18	9	50%

FEATURES

The Ready-Term® 8146 Series of terminal boxes are made of impact proof fiberglass reinforced polyester resin. They offer a one-source solution to the time-consuming process of providing ready to install terminal boxes for hazardous locations. With its single part number solution, the Ready-Term® 8146 Series eliminates the inconvenience of purchasing the enclosure and individual parts. This Series is supplied with the indicated quantity of individually numbered terminals for each size of enclosure, fully certified and ready to be installed.

The FRP Ready-Term® 8146 Series are made of specially formulated impact proof glass fiber reinforced polyester which provides superior corrosion resistance while dissipating static electricity.

In addition to the various North Americanapplications, this Series is PTB certified for use in Zones 1 and 2. The design conforms to CENELEC EN/IEC 60 079-7 and many others. Consult factory.

APPLICATION

Typical applications include junction boxes for petrochemical plants, waste treatment facilities, oil refineries and other major industrial plants. As a product with certifications recognized globally, the Ready-Term® 8146 Series is well suited for original equipment manufacturers who market throughout the world.

The 8146/1 Series of terminal boxes is intended for use on circuits designed for power and motor control applications.

The 8146/2 Series is intended for use on circuits which are intrinsically safe. These enclosures are outfitted with blue terminals to provide an indication to field personnel that the circuits are intrinsically safe and should not be confused with non-intrinsically safe circuits.

These enclosures make it necessary for the metal entry hardware to be bonded to the ground system. Use the suitable 8166/11 conduit hubs specified in the hub table on page C1.

Custom enclosures can be configured upon customer request.

The following modifications are available:
- Conduit hubs 8166 (specify)
- Cable glands (specify)
- Close-up plugs (specify)
- Flange plates (specify)
- Screw-type terminals up to 600 MCM
- Cage-clamp Terminals up to 8 AWG

8146 Series Terminal Boxes

INSTALLATION OF ENTRY HARDWARE

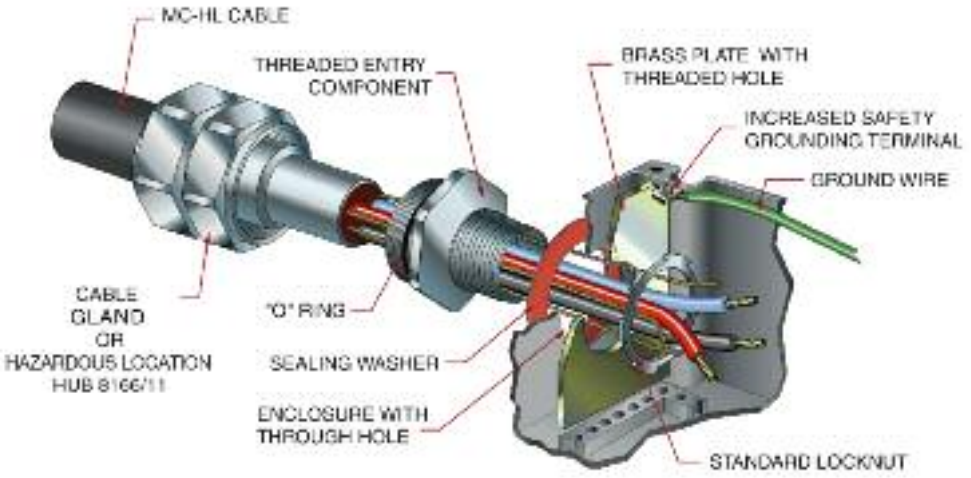
The 8146 Series of FRP terminal boxes are available with factory installed conduit hubs for conduit installation or with cable glands for cable installation.

Approved and suitable for the location entry hardware can also be field installed.

These enclosures make it necessary for the metal cable glands or conduit hubs to be bonded to the ground system. This can be accomplished by installing them to a threaded brass back plate as shown with Method 1 (shown on the upper half of this page), or with grounding nuts, according to Method 2 (shown on the lower half of this page).

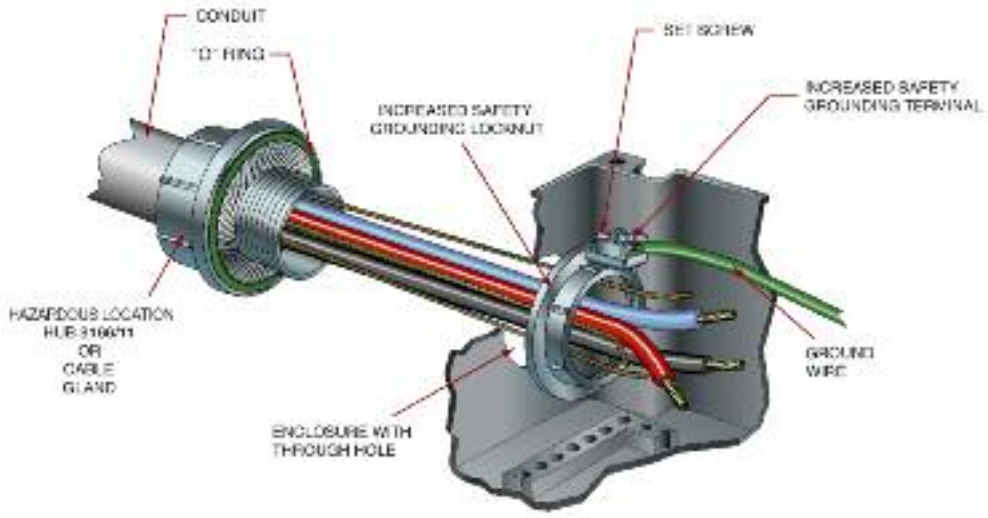
For cable glands see section J.

Method 1: Installation using a hole 'through the enclosure' with a brass back plate (see page C5 with a threaded opening and "increased safety" ground terminal.



Brass Plate(s) must be connected to internal grounding system using jumper wires.

Method 2: Installation using a hole 'through the enclosure' with an "increased safety" grounding locknut instead of a brass back plate.



These locknuts must be bonded between each other and to the grounding system using a jumper wire.

Table for max. numbers of entry openings either installed with conduit hubs 8166/11 or cable glands (see page C4) .

CAUTION:
The max. possible number of entries which can be installed on the sides of the enclosures depends on the number of terminal columns installed. With horizontally installed columns, there are no side entries possible or only limited, depending on enclosure size. With vertically installed columns there are no bottom or top entries possible, or only limited, depending on enclosure size.

Table for max. numbers of entry openings either installed with conduit hubs 8166/11 or cable glands (see section J).

CAUTION:
The max. possible number of entries which can be installed on the sides of the enclosures depends on the number of terminal columns installed. With horizontally installed columns, there are no side entries possible or only limited, depending on enclosure size. With vertically installed columns there are no bottom or top entries possible, or only limited, depending on enclosure size.

Electrical Capacity Tables

(only applicable for Class I, Zone 1)

In Class I, Zone 1 hazardous (classified) areas, heat produced by current in the wire inside an enclosure is a concern. Therefore, the continuous current of each current carrying conductor, the quantity and the size of the conductors inside a terminal enclosure needs to be limited. For each enclosure size, there is one table which shows the permissible values for that particular terminal enclosure.

How to use the electrical capacity tables:

- Determine the enclosure type you are dealing with.
- Reference the applicable electrical capacity table printed on pages C8-C12.

In the white area of the table the permitted numbers of current carrying conductors inside the enclosure are indicated (in and out counts two wires) depending on wire size and continuous current.

In the green shaded area of the table additional conductors/terminals are permitted up to the space limit of the enclosure. (see pages C1 & C2)

In the area with red diagonal lines no conductors/terminals are permitted.

Jumper links and ground wires can be neglected, in calculating the number of wires. These can be added whenever necessary.

EXAMPLE:

Enclosure type: 8146/1061-3DP-10021 (see page C1).

The maximum physical quantity of terminals 30-10 AWG for this enclosure is 21.

Reference the table 8146/1061 on page C9, you will find that 18 wires 10 AWG with 30 Amps continuous current is the thermal limit of this enclosure.

Conclusion: To terminate 18 wires, 9 terminals are needed, terminating two wires per terminal only. The remaining 12 terminals (21 - 9 = 12) can be used for low amperage circuits in the green shaded area of the table. Jumper links and ground wires can be neglected.

Mixed circuits of different wire sizes and current values are possible by applying the table values proportionally

i.e. enclosure table 8146/1061.

Wire Size AWG	Current Amps	Number of Current Carrying Conductors		Proportion
		Permissible	Actual	
14	15	24	12	50%
12	20	24	12	50%

100% Max.

Notes

Series Features:

- *Color coding and pin configuration makes it physically impossible to mate plugs and receptacles of different voltages and current ratings (per IEC 60 309-2).*
- *Interlocked switch mechanism prevents accidental removal of plug from receptacle under load.*
- *Horsepower rated disconnect switch*
- *20A, 30A, 63A and 125A models.*

INTRODUCTION

The 8570 and 8571 Series of plugs and switched receptacles provide unique solutions for electrical connections in hazardous and corrosive environments in the following industries:

Chemical	Pharmaceutical
Petrochemical	Offshore Energy
Refining	Coal Mining

They are made almost entirely from non-metallic material, and are available in 20A and 30A models.

This system makes the mating of plugs and receptacles of different voltages and current ratings physically impossible as required by the National Electrical Code. The plugs and switched receptacles are color coded according to voltage rating and ground pin position.

Each receptacle contains a horsepower rated disconnect switch. The circuit cannot be energized until the plug is inserted and the switch is turned to the ON position. The plug cannot be removed until the switch is turned to the OFF position, thus de-energizing the circuit.The switch handle is padlockable in the ON or OFF position.

SolConeX Flange Receptacles Series

INTRODUCTION

When more than one receptacle is required in one enclosure, the flange receptacles 8570/25 and 8571/25 offer the perfect solution. They are incomplete devices and must be installed in the wall of an enclosure in compliance with the mounting, spacing, casualty and segregation requirements of the ultimate application. R.STAHL offers completely assembled Receptacle Panels in any configuration in either FRP or stainless steel enclosures according to specifications.

ACCESSORIES

The wall and flange receptacles 8570 and 8571 accommodate up to two auxiliary contact blocks. They can be installed by snapping them into either side of the terminal block. They are not synchronized with the main contacts (Trailing - ON; Leading - OFF). There are two standard blocks one NC and one NO. The standard blocks are rated A600 (600VAC, 10A). If only one is fitted the contact may be used at its rating. If two are installed the current is limited to 5A on both contacts. There are also two I.S. blocks for intrinsically safe circuits, one NC and one NO and they both meet the requirements for simple apparatus as defined in Article 504 of NFPA 70. They all have cage clamp terminals for two wires 16 to 14 AWG.

Each receptacle contains an horsepower rated disconnect switch. The circuit cannot be energized until the plug is inserted and the switch is turned to the ON position. The plug cannot be removed until the switch is turned to the OFF position, thus de-energizing the circuit. The switch handle is padlockable in the ON or OFF position.

VALUE POINTS

The disconnect switch includes an auxiliary contact (late make, early break) as standard. This can be used for connection to a pilot light which can be used to signal power ON or power OFF, at a remote location.

HAZARDOUS LOCATION APPLICATION DATA

When CES plugs and switched receptacles are installed in Class II, Division 1 and 2, Group E or F classified locations, a dust cap must be installed when the plug is not engaged in the receptacle. See the technical data tables for dust caps catalog numbers.

Class I, Zone 2, Group IIC T6
Enclosure Type 3 & 3R

II 2G Ex de IIC T5/T6, IP65
PTB 01 ATEX 1001

Applications

Designed specifically for hazardous (classified) location clean rooms, such as found in the pharmaceutical industry, where equipment must be easy to clean and free of contaminant holding cavities. Electrical devices should also be flush wall mounted with concealed wiring, to minimize contamination.

Features

Available with single or duplex receptacles, in 16 or 30 amps with a variety of voltages, and pin configurations. See page D7.

Color coding and pin configuration makes it physically impossible to mate plugs and receptacles of different lvoltages and current ratings (per IEC 60 309-2)

Flush mounting, smooth contours for easy cleaning.

Hazardous (classified) locations suitability.

Enclosure made of 316 stainless steel with concealed gasket.

Interlocked switch mechanism prevents accidental removal of plug from receptacle under load.

The internal disconnect switch includes an auxiliary contact for indicating control circuits.

FEATURES

The 8003 pushbutton and control switch series are typically mounted in an electrical panel or enclosure, for custom control applications. They come with different actuators, contact arrangements and connection options as indicated on pages E2, E3 and E4.

Installation is easy and precise. To install, simply snap through a standard 30.5mm (1.20") pushbutton knockout. Hand tightening of the retainer nut makes the installation complete. The pushbuttons are suitable for hazardous (classified) locations in conjunction with the appropriate enclosure type (see above table for "Enclosure Type Rating For Installation").

FEATURES:
The 8013/3 Series of Pilot Lights are available for standard – and I.S. application. The Pilot Lights for standard application 8013/31•-al are capable to work on voltages between 12V up to 254V AC/DC.

The types 8013/32•-al are for connection with intrinsically safe circuits only and operate safely within the values stated in the above table "Intrinsic Safety Ratings Entity Parameters".

The installation should be in accordance with ANSI/ISA RP 12. 06. 01. Recommended Barrier: 9002/13-252-121-041

FEATURES:

The 8415 Pilot Light assembly consists of an LED/power pack 8010/3, one mounting bracket and one bezel/lens assembly. Five different colors are available: red, green, amber, white and blue.

The 8415 Pilot Light assemblies are available for power circuits – and intrinsically safe circuits. The types for power applications 8415/24 are capable to work on voltages between 12V up to 254V AC/DC.

The types 8415/24-50 are for connection with intrinsically safe circuits only, and operate safely within the values stated in the above table "Intrinsic Safety Rating Entity Parameters".

The installation should be in accordance with ANSI/ISA RP 12. 06. 01. and control drawing 80 106 01 31 3.

Recommended Barrier:
9002/13-252-121-041.

FEATURES:

The 8703 pushbutton assembly consists of contact block(s) 8082/1, one mounting bracket and one actuator 8602 - as listed on page F7.

The contact blocks have a single contact either 1 NC or 1 NO.

The terminals are accessible from the front, therefor the wires need to be connected before the contact block is snapped into the bracket.

Notes

ConSig 8040 Series

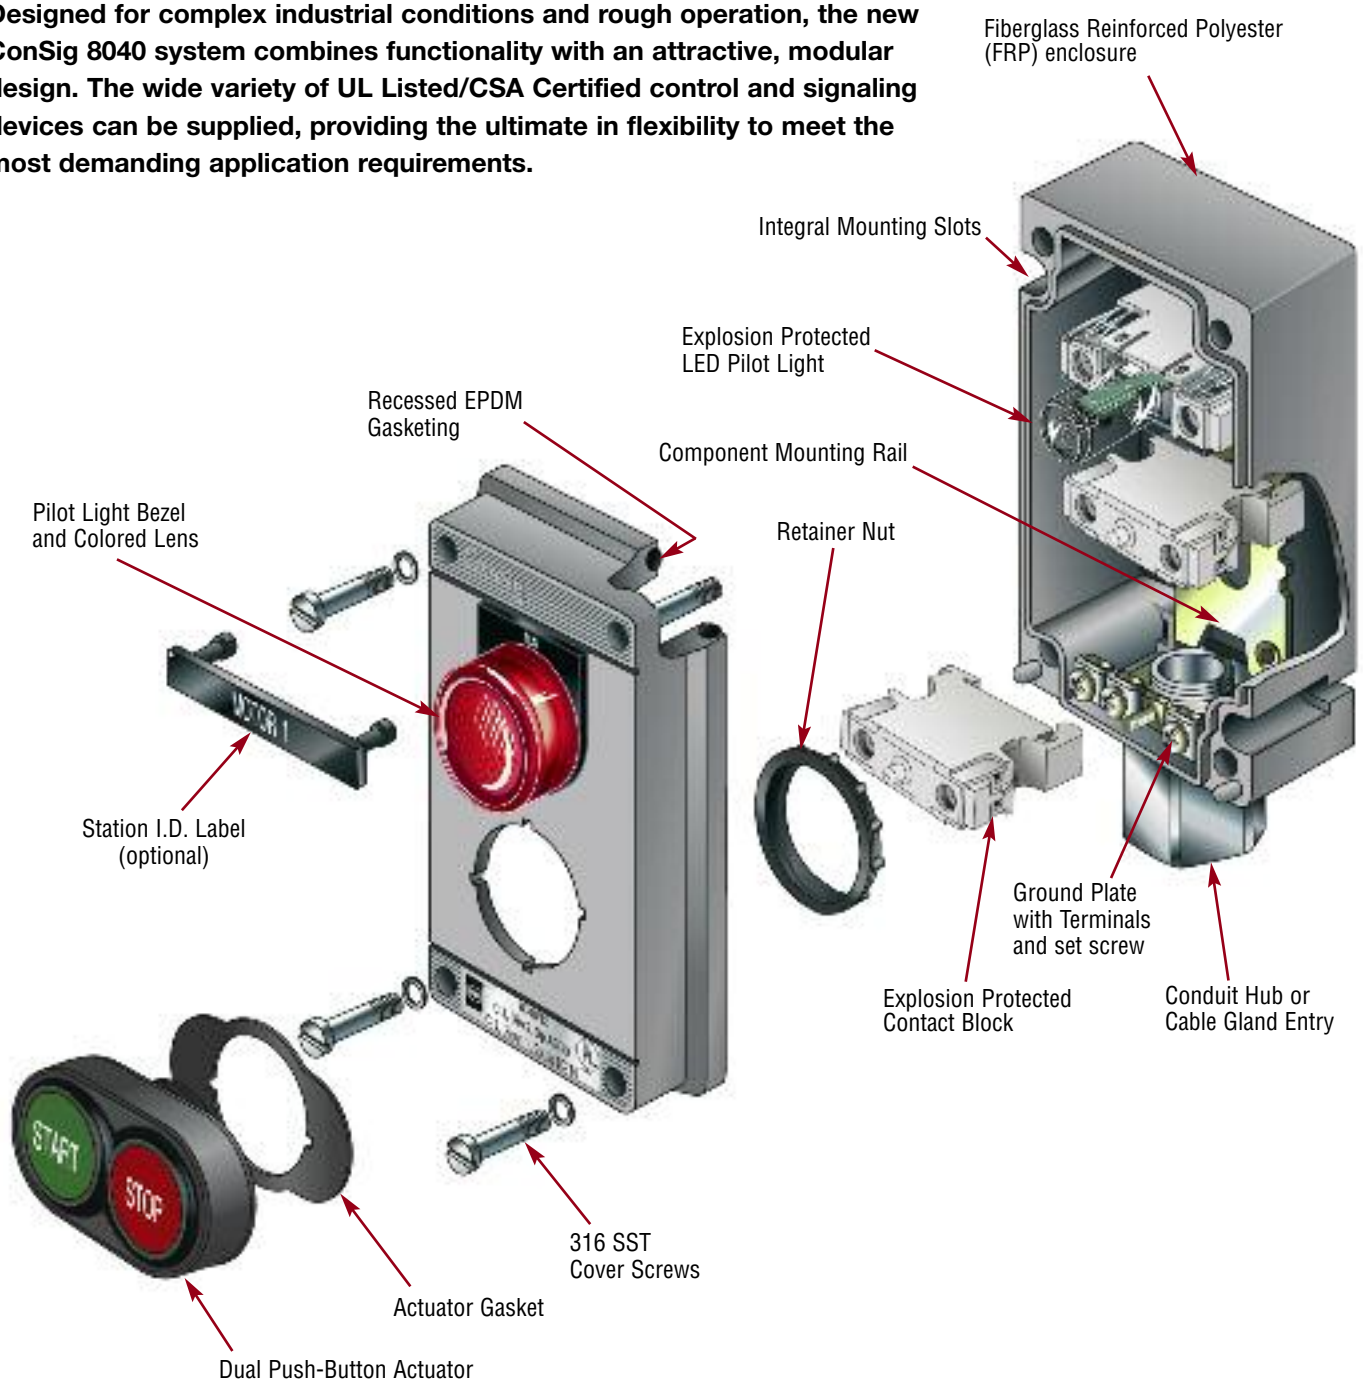
CONTROL & SIGNALING STATIONS

8040 Features:

- *Attractive space efficient design.*
- *A variety of enclosure sizes made of Fiberglass Reinforced Polyester (FRP).*
- *Snap-on mounting of individual components.*
- *High illumination LED pilot light from 12V to 254V, AC or DC with an operating life time over 100,000 hours.*
- *A variety of pushbuttons.*
- *Control switches.*
- *Illuminated pushbutton.*
- *Durable EPDM enclosure gaskets are concealed to protect from damage or premature aging by UV light and chemicals.*
- *Fluorsilicate gasket in standard pushbutton actuators is suitable for a wide temperature range.*

ConSig "Puts You In Control"

R. STAHL is setting new standards for function, design and technology with the new ConSig 8040 Series of control and signaling stations. Designed for complex industrial conditions and rough operation, the new ConSig 8040 system combines functionality with an attractive, modular design. The wide variety of UL Listed/CSA Certified control and signaling devices can be supplied, providing the ultimate in flexibility to meet the most demanding application requirements.



ConSig 8040 Series

CONTROL & SIGNALING STATIONS

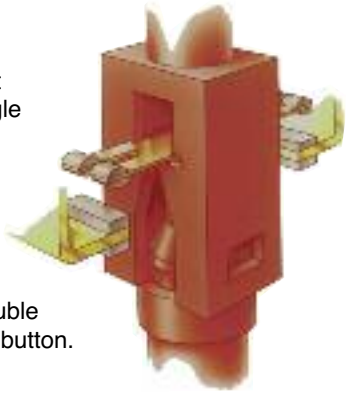
The ConSig 8040 Series is a new generation of control and signaling stations utilizing explosion protected components with non-metallic control housings for the ultimate flexibility, safety and durability in Hazardous (Classified) and Hostile (Corrosive) Locations.

This control and signaling station utilizes snap-on mounted components making field assembly quick and easy. Components include contact blocks with a variety of actuator options, LED pilot lights in all of the standard colors and voltages from 12V to 254V AC/DC, 2-pole and 4-pole control switches configurations and direct or indirect reading ammeters.

Enclosures

ConSig 8040 Series can be specified as one, two or three gang configurations and is made of Fiberglass Reinforced Polyester (FRP). Enclosure gasketing is durable EPDM which is concealed to protect it from premature aging by UV light and chemical elements. Components snap-on to the rail provided.

Contact Blocks



The contact system incorporates 8082 Series contact blocks which are individually explosion protected single pole units and are available as 1 N.O. or 1 N.C. The contact blocks incorporate a parallel bridge contact (H-contact) designed to ensure utmost contact reliability even with very low control voltages and currents. Any combination can be installed to provide a complete range of control configurations. Standard actuator styles include a double push-button, booted pushbutton and illuminated pushbutton.

LED Pilot Lights

ConSig 8040 Series introduces an extraordinary compact LED pilot light unit. The 8010 Series pilot light incorporates electronics which allow the same unit to operate at any voltage from 12 to 254 Volts, DC to 60 Hz. High output LEDs are used to provide superior illumination levels which are visible in direct sunlight from the front or side. The bezel is clear and the snap-on lenses are added in the colors Red, Green, Amber, White and Blue!

Control Switches

8008 Series control switches offer over 300 different switching configurations. They are available as 2-pole and 4-pole units incorporating maintained or spring return action. The control switch is for quick and easy snap-on mounting. Three styles of handles, with or without padlocking provision can be used in conjunction with the switches.

Illuminated Push-Buttons

Illuminated push-buttons make it possible to have control and signaling functions in the space of one. This is achieved by combining the 8082 Series Contact Blocks and 8010 Series LED Pilot Lights under a special illuminated pushbutton actuator which is spring return with a clear bezel and five colored snap-in filter disks in Red, Green, Amber, White and Blue.

Ammeters

ConSig 8040 Series offers a cost effective ammeter station as a solution for applications in a Hazardous (Classified) Location. The 8405 Series ammeter is a moving iron core instrument available in direct or indirect read versions. A manually adjustable red pointer provides quick and easy comparison of the actual circuit operation. The ammeter is for quick and easy snap-on mounting.

HOUSING MATERIAL AND GASKETING
Fiberglass Reinforced Polyester (FRP) with EPDM recessed gasketing.

FEATURES
The ConSig 8040 Series of control & signaling stations with its many enclosure sizes and components is uniquely flexible. If the preconfigured control stations on pages F3 and F4 do not meet your specific application needs, take advantage of the flexibility of ConSig 8040 and use the custom configuration logic tables on the right to custom configure a control station which can exactly meet your particular application.

How to use configuration logic tables:

Fill in the blanks in the light blue striped fields located on the top of pages F5 and F6 left to right from information stated below the individual fields.

Step 1: Select enclosure size
Step 2: Select entry or entries
Step 3: Select the device mounted to the cover as well as the device mounted into the back box.
Step 4: Repeat step 3 when configuring a two-gang station.
Step 5: Repeat step 3 when configuring a three-gang station.

DIMENSIONS
For dimensional data see page F15.

PUSH BUTTON ACTUATORS

APPROVALS

FILE No. E182378

CERTIFIED - FILE No. LR99480

PTB 01 ATEX 1129 U

IECEx PTB 06.0014 U

STAHL offers a large variety of push-button actuator versions including momentary and maintained action in standard, booted, mushroom, keyed and selector switch styles. A new double push-button actuator combines two control functions in the space of one with the same size button.

Up to three 8082 contact blocks can be mounted under each push-button actuator. Under the double momentary push-button 23, up to four 8082 contact blocks can be mounted. Legend disks, in a variety of standard markings, snap into the center of the actuator making the button function easily identifiable.

The rail mounted 8010 Series LED Pilot Light accommodates any voltage from 12 to 254V AC or DC in one compact unit!

High intensity LED's provide superior illumination levels that are easily viewable in direct sunlight from the front or side.

Long life & low temperature make these ideal for hazardous location applications.

Series 8082/8010 Illuminated Pushbuttons have contact blocks and LED pilot lights combined under one actuator. The possible contact blocks are either 2 N.C., or 2 N.O., or 1 N.O. and 1 N.C. By wiring the individual components appropriately, different switching and indicating functions can be achieved.

The lamps may be operated at any voltage between 12V and 254 V AC/DC. They are available in red, green, amber, white and blue.

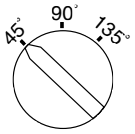
The 8008 Series is a two pole and a four pole control switch which is rail mountable via a supplied adapter plate. Control switch bodies are made from polyester and designed to contain the pressure generated by an internal explosion. The switches are available in over 300 different contact configurations. The most common 2-pole switching arrangements are illustrated on this page. The 4 pole switching arrangements are illustrated on page F12. For more configurations, consult factory.

Ordering Information

Selector switch specification example: 8008/2-038

How to read the diagram:



First we note that there are three positions to which the handle can be turned: 45° left position, 90° center position and 135° right position.

The first contact, designated by terminal numbers 13-14 is open when the handle is in the left position (45°) [blank square], it is also open in the center position (90°) [blank square], and is closed in the right position (135°) [square marked with an X].

The second contact, designated by terminal numbers 23-24 is open in the left position (45°) [blank square] and is closed in the center position (90°) [square marked with an X]. At the right position (135°) the contact remains closed [square marked with an X].

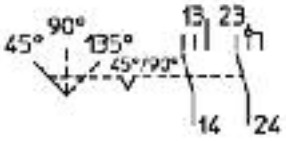
The terminal numbers are marked on the switch block.

See chart below for a selection of available contact configurations. For other contact configurations, consult factory.

Technical Data for 2 and 4 Pole

	NEC/CEC	IEC
Rated Voltage	600V	690VAC
Rated Current	10A	16A
Mechanical Life	≥ 10^5 Operations	
Electrical Life	≥ 10^5 Operations	
Terminals	12AWG	2.5mm²

MAKE BREAK DIAGRAM	CONTACT ARRANGEMENT	ORDERING CODE 038
		



Note: The above denoted 45°/90° at the notch indicates that in these two positions the switch is maintained, and the unmentioned 135° position is spring return to the 90° center position. The contacts are drawn in the 45° position. This is indicated by the solid 45° line.

The 8405 Series ammeters are used to measure current of a motor supply circuit in a potentially explosive atmosphere.

They are available in both direct and indirect reading versions (current transformer not supplied) with slide in scales to accommodate any amperage range required.

A red pointer can be manually adjusted for quick visual comparison of the actual value with the set value.

The supplied adapter plate allows the unit to be rail mounted for snap-on-installation.

A potentiometer functions as a variable resistor. It is used to adjust resistance in a control circuit to vary motor speed or other applications.

The housing is made from polyester and designed to contain the pressure generated by an internal explosion.

The supplied adapter makes it rail mountable for snap-on-installation.

Features:

8150 series control stations are designed to incorporate control and display devices. The number of units installed depends on the control station size and the space required to fit each device.

- Enclosures in 316 or 304 stainless steel
- 6 basic enclosure sizes
- Options:
  - Flanges
  - Cover Hinges
- Enclosures can be coupled together

For entry hardware see pages C41, C42 & Section J

Components:

- Contact blocks
- Pilot lights
- Illuminated buttons
- Control switches
- Ammeters
- Voltmeters

For component data see pages F7-F14 and F37-F39

Features:

Control and display devices are assembled in a clear layout in 8146 series control stations. The number of installed components depends on the control station size and the space required to fit each device.

- Enclosures in fiberglass reinforced polyester (FRP)
- 7 basic enclosure sizes
- Different enclosure depths
- Options:
  - Flanges
  - Cover Hinges
  - Flanged enclosure
  - Brass plates for metal cable entries

  For entry hardware see pages C37, C39 and C40
- Can be combined to larger units

Components:

-Contact blocks
-Pilot lights
-Illuminated buttons
-Control switches
-Ammeters
-Voltmeters

For component data see pages F7-F14 and F37-39.

Ta ≤46˚ C	≤5.0 A	T5
Ta ≤70˚ C	≤6.3 A	T4

FEATURES:

- The small fuse base 8560 Series is designed for 250V AC/DC for low amperage circuits from 32mA to 1.25A in quick-acting characteristic and from 2A to 6.3A in time-lag characteristic.
- The fuse base is for quick and easy snap-on mounting on DIN rails TS15, TS35 and TS32.
- They need to be mounted into “increased safety” certified enclosures i.e. the STAHL Series 8125 or 8146 Terminal or Control Enclosures.

IECEx PTB 06.0017 U

Ammeter

The 8403 Series ammeters are used to measure current of a motor supply circuit in a potentially explosive atmosphere.

They are moving iron instruments with an accuracy class 2.5.

They are available for direct measuring up to 25 Amps, and for indirect measuring in conjunction with a current transformer either for 1 Amp or 5 Amp secondary current. For indirect measuring slide-in scales are available. Ammeter/slide-in scale must have the same ratio that the CT has. (CTs are not supplied).

A red pointer can be manually adjusted for quick visual comparison of the actual value with the set value.

Voltmeter

The 8404 Series of voltmeters are used to measure voltage of a motor supply circuit in a potentially explosive atmosphere.

They are moving iron instruments with an accuracy class 2.5.

A red pointer can be manually adjusted for quick visual comparison of the actual value with the set value.

Both 8403 Ammeters and 8404 Voltmeters are suitable to mount into increased safety enclosures Series 8125 or 8146.

The lockout Terminal 8082/1-1-01 has one NC contact and is operated by the black lever. It is also lockable with a padlock.

Each block is made of polyamide and designed to contain an internal explosion.

The terminals are designed to increased safety “e” requirements.

8146 Series Fire Alarm Stations

HAZARDOUS LOCATIONS

8146 Fire Alarm Stations

Features:

- *The Fire Alarm Station is made from corrosion resistant fiberglass reinforced polyester. The enclosure is molded from highly visible bright red material.*
- *The enclosure gasket is made from polyurethane and is installed into recessed cover groove.*
- *The cover screws are captivated, slotted and made of 316 grade stainless steel.*
- *1/2" and 3/4" hubs are available in dead-end and feed-thru configurations.*
- *A hammer is mounted to the side of the alarm station and is attached by an 11" chain.*

Application

These Fire Alarm Stations are used to activate alarm circuits in hazardous and/or wet, corrosive industrial applications. The fire alarms are of the break-glass type construction.

Two styles of stations are available:

Automatic Model– after glass is broken, actuator is automatically released to activate alarm circuit.

Manual Model– after glass is broken, actuator must be pushed to activate alarm circuit.

Automatic Model–1.5" (38mm) O.D. Red Momentary Pushbutton Actuator is released when glass is broken.

Yodalex YL6/YO6/FL6 Series

Yodalex YL6/YO6FL6 Series

Features:

- *YL6 Football shaped horn/strobe combination unit weighs only 13 pounds*
- *Omni Directional high output horn 110dB max @ 1 meter*
- *2 stage alarm, independently selectable 2nd stage*
- *All units share a common explosion proof housing - machined flame paths*
- *Meets UL, CUL, CSA, GOST, ATEX and IECEx Approvals*
- *ATEX / IECEx Approved for Gas & Dust (Zone 1 & 2, 21 & 22)*
- *Dual cable entry*
- *Aluminium enclosure with stainless steel hardware*
- *Lens guard provided as standard*
- *5 Joule xenon - flash rate 1 per second.*
- *Weather proof flame retardant ABS compliant horn*
- *7 Lens colors in flame retardant polycarbonate*
- *32 selectable tones meeting international regulations*
- *Easy sound selection via DIL switches*
- *10 & 20 Joule Beacon available with ATEX or IECEx certification*
- *Telephone initiate available on ATEX or IECEx models*

8146/5-6 Series Disconnects

DISCONNECT SWITCHES FOR HAZARDOUS & CORROSIVE ENVIRONMENTS

Disconnects 8146/5-6 Series Features:

- *16A, 32A, 63A and 125A models.*
- *Enclosures made of Fiberglass Reinforced Polyester (FRP) with recessed gasket and captive stainless steel cover screws.*
- *3 pole (plus auxiliary) horsepower rated switch.*
- *Increased safety terminals and integrated ground bar.*
- *Large grip, lockable handle.*
- *Multiple entry methods available (see section J).*
- *No seals required for Division 2 application.*

***Consult Factory**

Applications

The DISCONNECTS 8146/5-6 series are horsepower rated for motor load applications. While the product is load rated, no short circuit protection is designed into the switch.

To provide adequate short circuit protection, properly sized Class J fuses must be installed in the circuit upstream from the switch.

Due to the design of the switch, no external sealing fittings are required for Class I, Division 2 applications. Some Class II applications may require installation of seals. Consult the National Electrical Code Article 502-5 or the Canadian Electrical Code Section 18 (154) for specific instructions.

STAHL offers the DISCONNECT Series 8146/5-6 constructed to meet the most demanding environments. The Disconnect 8146/5-6 Series provides safety in hazardous and corrosive locations.

Broz™ Hazardous Classified Breaker Panelboards

Applications:

- For hazardous classified locations due to explosive gas atmospheres
- Petroleum refineries, oilsands, chemical and petrochemical facilities with indoor or outdoor processes
- Applications requiring overcurrent and short circuit protection for power, lighting, and heat tracing.

Features:

- Extremely easy to maintain. Simply enter the enclosure by turning the door handle and gaining access to the breaker compartment. There is no need to remove dozens of bolts to change a breaker.
- Lightweight and easy to install compared to traditional explosion proof construction. Expensive lift equipment often not needed.
- Window doors allow easy viewing of breaker positions without opening the enclosure.
- R. STAHL 8562 series circuit breakers with 10KA interrupt ratings meet all necessary North American requirements. See page H7.
- 8562 series breakers are padlockable in the off position.
- GFIs and GFCIs are also available for ground fault protection. See pages H11 - H12.
- Seamless foam in place gaskets exclude contaminants and liquids ensuring long life of interior components.
- Available in brushed stainless steel, epoxy powder coated, and fiberglass for maximum corrosion resistance.
- 316L stainless steel hardware provided for all external components to prevent corrosion.
- NEMA 4X padlocking 316L SS handle and internal heavy duty 3 point latching system combine security and a watertight seal with ease of access.
- No cable or conduit seals are required, allowing for fast installation and lowering overall installed cost.
- Standard bottom entry reduces risk of moisture ingress. (Top entry is available)
- Finger safe construction & UL508A approved bus system prevents accidental contact with live parts.
- Enclosures are easily punched in the field. No drilling and tapping required.

**Breaker information located on pages H9 - H11.*

CLASSIFICATIONS of Breaker

NEC

Class I, Zone 2 Group IIC, T4
Class I, Div. 2, Groups B, C & D, T4

CEC

Class I, Zone 2 Group IIC, T4
Class I, Div. 2 Groups B, C & D, T4

Environmental Protection

Type 3, 4, 4X; IP66

SAVE INSTALLATION TIME

- Avoid removing dozens of bolts as with traditional explosion proof ferrous systems.
- No expensive seals
- No drill and tapping enclosures
- Light weight design (No need for expensive lift equipment)

SAVE ON MAINTENANCE

- Window doors allow easy viewing.

LAST LONGER

- Stainless Steel, and fiberglass options outlast traditional cast aluminum in corrosive environments

WORK SAFER

- Finger safe construction prevents accidental contact with live parts.
- Padlockable breakers

BREAKER PANELBOARDS FOR HAZARDOUS & CORROSIVE ENVIRONMENTS

Breaker Panels

Features:

- *Wide variety of Flameproof branch circuit breakers for Zone 1 & Division 2 to UL 489 & CSA C22.2 No. 5*
  - *Thermal-magnetic branch circuit breaker protection, 40A max.*
  - *Mounted under hinged window flaps for easy actuation.*
  - *Shunt trips (optional).*
  - *Lockout on breaker and window flap.*
  - *Line and load side factory wired to "increased safety" terminals, ready for field connections*
  - *Flameproof Ground Fault Interrupters*
- *Flameproof main disconnect switches 125A max. with lockout provision (optional).*
- *FRP "increased safety" enclosures*
  - *Suitable for wet and corrosive locations*
  - *Impact resistant*
  - *Light weight*
  - *Wall mounting frames available*
  - *Flange Plates can be fitted with "Increased Safety" certified conduit hubs or cable glands (see section J).*
  - *No seals required for Division 2 application.*

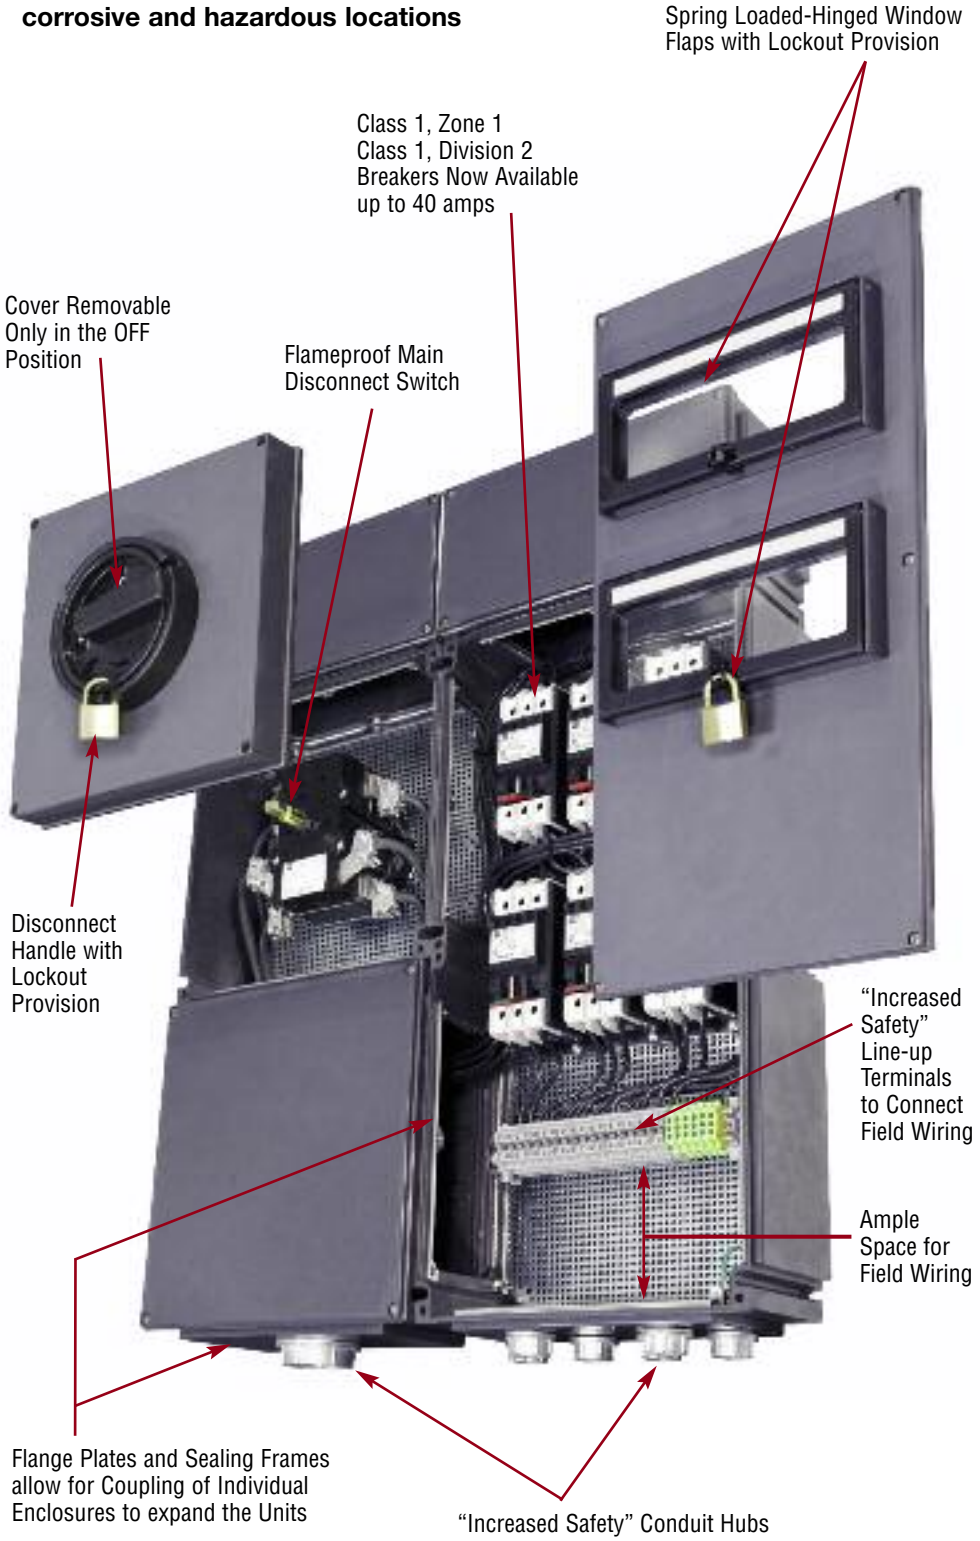
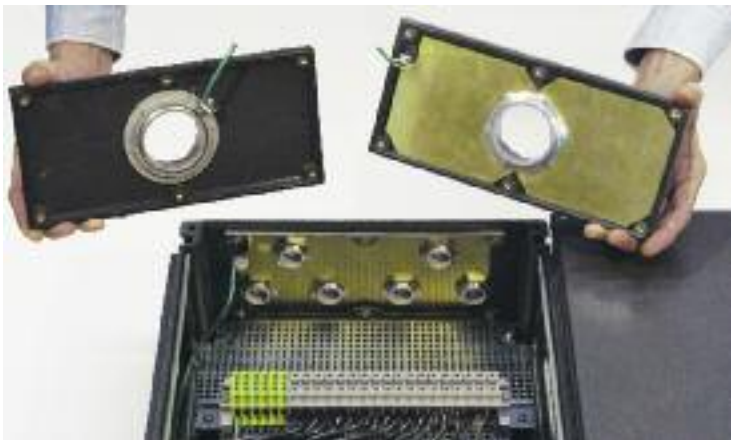
Ambient Temperature Range
+40°C (+104°F) Max.
–20°C (–4°F) Min.

Applications

The series 8146/5 Breaker Panelboards provide a switching system with short circuit protection, overload protection and ground fault protection for feeder and branch circuits to control either resistive or inductive loads. Applications would be heating, lighting, heat tracing and motor circuits in refineries, chemical and petrochemical plants and other process industries. They are available with or without Main Disconnect. To provide adequate short circuit protection, properly sized Class J fuses must be installed in the circuit upstream for protection of the Main Disconnect Switch.





Conduit hubs or cable glands can be installed with back-up bonding plates, as shown above or with “increased safety” grounding locknuts which are interconnected with green jumper wire and also connected to the ground system.

For details see page C3, and for spacing see page C4.

Springloaded - hinged window flaps allow easy viewing and quick access to breakers without opening the enclosure.

Individual breakers and the window flaps can be padlocked.

FEATURES

The Ex GFI Series 8562/5 is an explosion protected ground fault interrupter which assures ground fault protection for equipment and to a lesser extent personnel protection. The 8562/53 and 8562/54 can come with one Auxiliary contact, actuated by the breaker handle or one Alarm Contact actuated in case of ground fault.

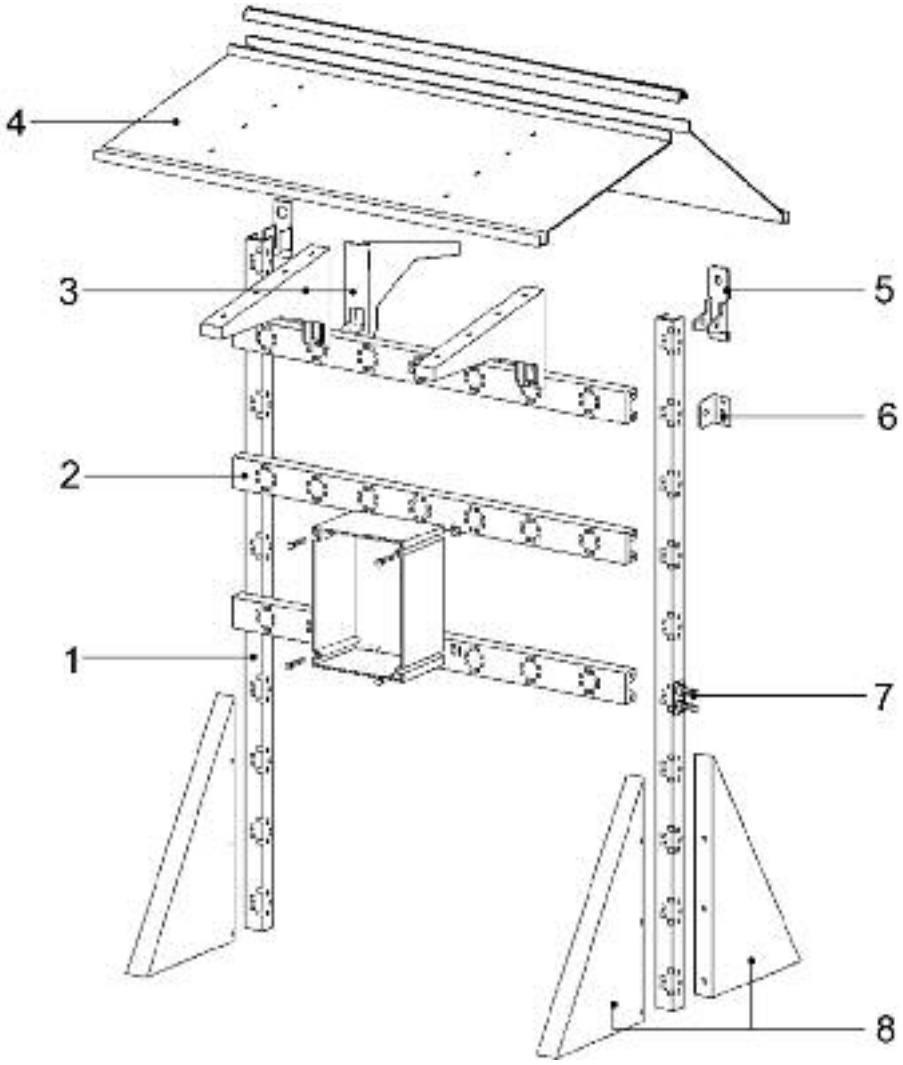
8298 Series Support Frame System

FOR BREAKER PANELS SERIES 8146/5

1. Vertical Supports
2. Horizontal Supports
3. Bracket for Roof Attachment
   - To secure roof
   - Can be used to mount a luminaire.
     See Catalog Section B.
4. Roof
   - For additional protection of the breaker panel from the elements.
5. Brackets
   - End piece for transportation and wall mounting. Possible on top and bottom.
6. Fixing Angle Brackets
   - For wall mounting (on left and right side)
7. Bonding terminal
8. Triangle Support
   - Free standing
   - Can be fixed to the floor
9. Material Galvanized Steel



Wall Mounting Frame for Breaker Panel shown on page H5.

APPLICATIONS

The Series 8265 of threaded enclosures are for use in hazardous (classified) locations as specified above under CLASSIFICATIONS. They are designed to contain ordinary location electrical components for Instrumentation and Motor Control. The four sizes are available with or without windows, and come either with customized, factory drilled and tapped entry openings, or they also can be field modified. (see Field Drilling/Tapping Information on Page I2).

8264 Series of Enclosures Made of Aluminum or Stainless Steel

Features:

- *Copper Free Aluminum – High strength, light weight and corrosion resistant.*
- *Stainless Steel – Best material solution for challenging environmental conditions.*
- *Gasketed Flange – "O" ring gasket is located inside the cover bolts.*
- *Flat Cover – Provides space for operator installation.*
- *Rectangular or Round Windows – Can be factory installed to enable viewing of digital read out meters and other devices.*
- *Conduit Openings – Enclosures are designed with a wall thickness suitable for drilling and tapping of conduit openings up to 2" max.*
- *Stainless Steel Hinges – All enclosures are provided with factory installed hinges which allow easy access for inspection, maintenance and system changes.*
- *Mounting Rails – Standard.*
- *Internal Mounting Plate Bosses – They are factory machined to enable field installation of the optional mounting plates.*
- *Optional Finish – Powder Coating.*

APPLICATIONS

The Series 8264 are Explosion Proof and Dust Ignition Proof enclosures made of Copper Free Aluminum or Stainless Steel 316L. They are suitable for use in hazardous (classified) locations as specified above.

They are designed to contain ordinary location electrical components for Instrumentation, Motor Control and Distribution. There are eight sizes of enclosures and they all come with Stainless Steel cover hinges and mounting rails as standard. Mounting Plates are optional and need to be ordered separately.

They can be customized with drilled and tapped entry openings as well as round and rectangular windows and operators.

Entry and operator openings can be field modified. For details regarding Aluminum Enclosures see pages I9 and I10. For Stainless Steel Enclosures see pages I11 and I12.

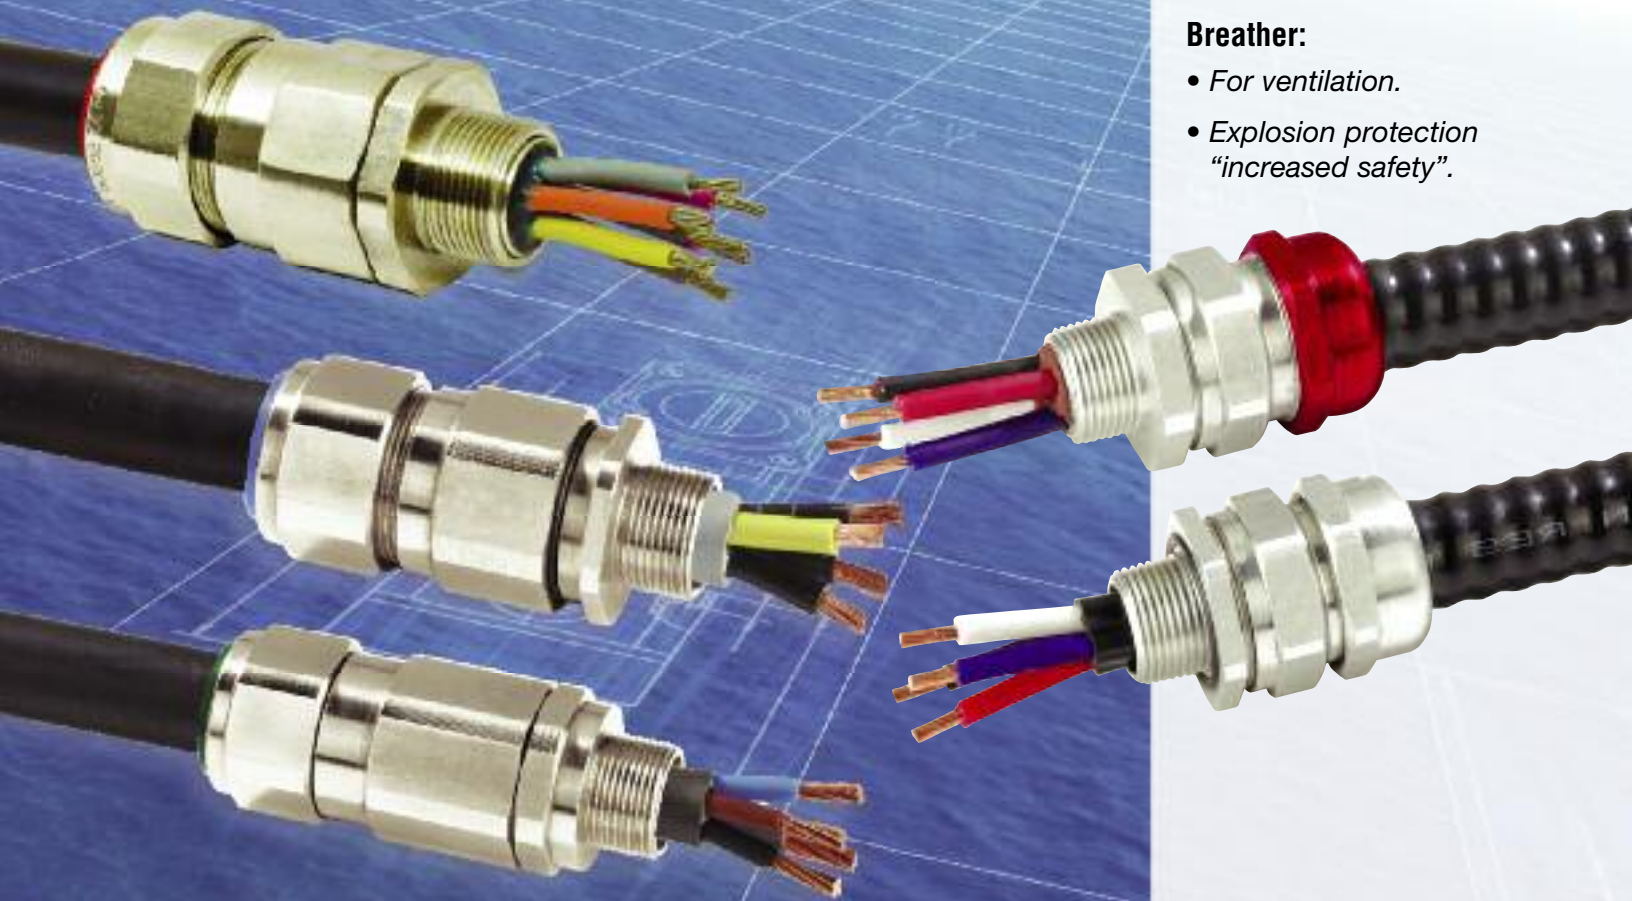
Notes

Conduit Hubs, Cable Glands & Breather



Conduit Hubs:

- *For connecting conduit.*
- *Sizes 1/2"-3" NPT.*
- *For Hazardous (classified) Locations.*
- *Material Zinc.*

Cable Glands:

- *For connecting all types of cables.*
- *Sizes 1/2"-4" NPT.*
- *For Wet and Hazardous (classified) Locations.*
- *Several gland materials available.*

Breather:

- *For ventilation.*
- *Explosion protection "increased safety".*

Grounding Terminal Capacity:
One or two copper wires,
14 to 8 AWG, solid or stranded

FEATURES

The 8166/11 Series of Conduit Hubs are listed for hazardous (classified) locations as specified above and are suitable for installation of rigid conduits with 1/2" - 3" NPT threads to metallic and non-metallic enclosures with appropriate ratings. They also provide a sure watertight seal by means of an embedded "O" Ring.

They are made of zinc and are provided with a protective, insulated throat. The grounding locknut provides an "increased safety" terminal which prevents the ground wire from rotating when tightening. The locknut also has a set screw which after tightening provides firm metal-to-metal connection between the HUB body and the locknut.

Hazardous Location Conduit Hubs with "Increased Safety" Grounding Terminal

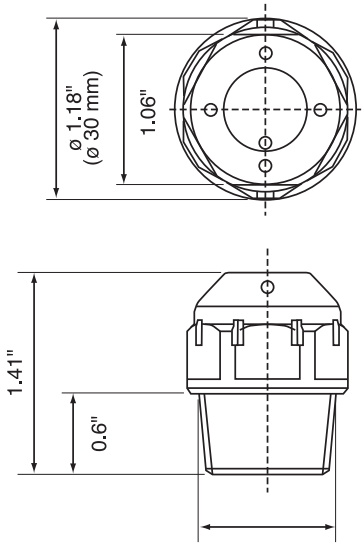
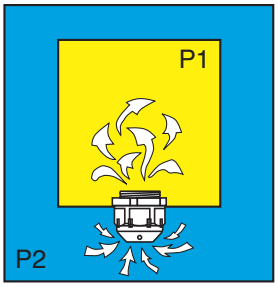
Dimensions





Temperature-dependent pressure differences between the interior of an enclosure (P1) and the external atmosphere (P2) are reliable equalized by means of the breather. Condensation build-up in the enclosure is thus kept to a minimum.

CLASSIFICATIONS
NEC- Class I, Zones 1 & 2 AEx e II
Class I, Division 2

LISTED - File No. E200949

FM APPROVED
File No. 3000248
Material: Nylon
Ingress Protection
IP54, Type 3R
when installed in enclosures of the same rating

Application
The breather is designed for ventilation where there is the possibility of moisture or condensation being trapped within an enclosure.

Features:
The breather is suitable for installation in 3/4" conduit hubs or drilled and tapped conduit openings of general purpose or increased safety enclosures. They must be protected from severe impact. The felt insert is replaceable.

C2KX Cable Glands

FOR WET & HAZARDOUS LOCATIONS

CLASSIFICATIONS

NEC- Class I, Zone 1, AEx e II
Class I, Div. 2, Groups A,B,C & D
NOTE: When installed in compliance with the NEC.

Types 4X; IP66, IP67 & IP68
NOTE: For IP67 and IP68 requirements the cable diameter "B" (minimum value) shown in table should be increased by 1.0 mm to ensure compliance.

FEATURES

The C2KX cable gland is suitable for use with armored and jacketed cables with wire braid armor. The cable gland provides mechanical retention and electrical continuity via the armor termination. The standard cable gland material is Electroless Nickel Plated Brass as pictured above. Optional materials are: Stainless Steel or Brass with Electroless Nickel Plated Brass entry component.

FEATURES

The T3CDS cable gland is suitable for use with all types of armored and jacketed marine cables with wire braid armor or served (single) wire. The cable gland provides a seal on the cable inner bedding and an environmental seal on the cable outer jacket. The T3CDS incorporates a unique Compensating Displacement Seal (CDS) system which provides full compatibility with restricted breathing equipment. The cable gland provides mechanical cable retention and electrical continuity via armor wire termination. A reversible armor cone and AnyWay universal clamping ring allows easy disconnection in confined or areas of restricted access from equipment for maintenance or change out.

FEATURES

The TMC cable gland is suitable for all types of interlocked, continuously welded or corrugated metal clad armor cable and types MC, MC-HL or TECK armored and armored & jacketed cable. The cable gland provides mechanical retention and electrical continuity via the armor termination and an environmental seal on the cable outer jacket. The TMC cable gland comes as standard in Aluminum, complete with O-Ring and Locknut. It allows for easy disconnection from equipment, for maintenance and change out. The gland utilizes a re-usable compression spring that provides grounding and gripping functions to the cable armor. The standard cable gland material is Copper Free Aluminum (<0.4%), as pictured above. Optional materials are: Stainless Steel or Electroless Nickel Plated Brass.

FEATURES

The PX2KXREX gland utilizes a liquid pour resin seal, that vastly reduces installation time and associated costs. This solution is particularly effective on multicore cables where traditional compound is difficult and time consuming to apply. PX2KX-REX Class I Division 1 ABCD Cable Gland for use with Armored & Jacketed cable providing a barrier seal around the cable conductors and an environmental seal on the cable outer jacket. In addition this cCSAus listed cable Gland provides mechanical cable retention and electrical continuity via armor termination. A detachable armor cone and AnyWay universal clamping ring arrangement allows the cable to be easily disconnected from the equipment.

FEATURES

The PXSS2KREX gland utilizes a liquid pour resin seal, that vastly reduces installation time and associated costs. This solution is particularly effective on multicore cables where traditional compound is difficult and time consuming to apply. PXSS2K-REX Triple Certified Flameproof (Type 'd'), Increased Safety (Type 'e') and Restricted Breathing (Type'nR') cable gland for use in Zone 1, Zone 2, Zone 21 and Zone 22 Hazardous Areas with all types of unarmoured cable providing a barrier seal around the cable conductors and an environmental seal on the cable outer sheath. The cable gland provides mechanical cable retention. A combined detachable spacer and resin tube allows the cable to be easily disconnected from the equipment.

Locknuts, Sealing Washers & Serrated Washers

FOR WET & HAZARDOUS LOCATIONS

Locknuts

Electroless Nickel Plated Brass Locknuts are the recommended items for securing brass cable glands with nickel plated entry components.

This prevents the electrolytic action of galvanic corrosion which can occur when dis-similar metals are coupled together.

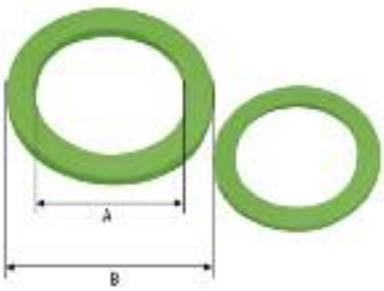
Sealing Washers



To maintain the Ingress Protection rating between the equipment and cable gland it is necessary to fit an Entry Thread Sealing washer at the gland entry interface.
